## Keywords:

Condensation, propane-1,3-diamine, formaldehyde,
X-ray diffraction analysis.

#### Abstract

The condensation of formaldehyde with propane-1,3-diamine gave four products depending on the conditions of the reaction of them dimer, trimer, tetramer and pentamer of $N, N^{\prime}$-bis(methylene)propane-1,3-diamine products $\left(\mathrm{CH}_{2}=\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}=\mathrm{CH}_{2}\right)$. Their structures were determined by MS, elemental analysis and ${ }^{1} \mathrm{H}$ NMR spectroscopy methods. The structure of the pentamer was additionally determined by $\boldsymbol{X}$-ray diffraction analysis.

## Introduction:

The study of mass spectroscopy of products of the condensation process of formaldehyde with propane-1,3-diamine showed, that their products depend on the conditions of the reaction, which gave different products such as dimer, trimer, tetramer and pentamer $\mathrm{N}, \mathrm{N}^{\prime}$ - bis (methylene) propane -1,3-
diamine, $(\mathrm{CH} 2=\mathrm{NCH} 2 \mathrm{CH} 2 \mathrm{CH} 2 \mathrm{~N}=\mathrm{CH} 2)$. Tetramer (1) (Scheme 1) one of these products known in literature. Krassig [1] found this product with yield approaching $80 \%$ in ${\mathrm{N}, \mathrm{N}^{\prime} \text {-dimethylformamide is used }}_{\text {der }}$ as formalin solution.

## Experimental:-

Melting points were recorded with Gallenkamp melting points Apparatus. Elemental analysis was carried out in Perkin-Elmer 2400, elemental analyzer, table (1). Mass spectra were recorded on a Finnigan MRT-90 instrument (direct inlet- probe, voltage 5.0 kV , cathode emission current $100 \mu \mathrm{~A}$, ionizing electron energy 70 eV , ionization chamber temperature $200{ }^{\circ} \mathrm{C}$ ). Perfluorokerosene was used as a standard. The resolution was $\mathrm{M} / \Delta \mathrm{M}=10000$. The injector temperature was $20^{\circ} \mathrm{C}$, Mass spectra table (2). 1 H NMR spectra were recorded on a Bruker WM-250 spectrometer ( 250 MHz ) for $2-3 \%$ solutions of the compounds under study in $\mathrm{CDCl} 3,1 \mathrm{H}$ NMR table(3). X-ray diffraction analysis. Experimental material for crystals was measured on automatically diffractometer Enraf-Nonius CAD-4 (MoKa), table (4). The course of

[^0]the reactions was monitored and the purity of the products was checked by TLC on Silufol UV-254 plates. Spots were visualized with iodine vapor in a moist chamber. All final products were measured in Republic of Russian Federation.

> 1,3,7,9,13,15,19,21-Octaazapentacyclo-
[19.3.1.13,7.19,13115,19]octacosane (1). To 4 ml (47 mmole) propane-1,3-diamine with vigorous stirring at room temperature for $10 \mathrm{~min}, 2.85 \mathrm{gm}$ ( 95 mmole ) of formaldehyde in small portions was added with continuous stirring, until formaldehyde was completely dissolved. The reaction mixture was evaporated and the residue was recrystallized from isopropyl alcohol. 1,3,7,9,13,15-Hexaazatetracyclo [13.3.1.13,7.19,13]unicosane (2). To 8 ml ( 95 mmole ) propane-1,3-diamine in 30 ml water with vigorous stirring at room temperature for $10 \mathrm{~min}, 5.7 \mathrm{gm}$ (190 mmole) of formaldehyde in small portions was added with continuous stirring, until formaldehyde was completely dissolved. The reaction mixture was left for 24 h . and the precipitate was filtered and dried. 1,3,7,9-tetraazatricyclo[7.3.1.13,7]tetra-decane (3).

To suspended solution of formaldehyde 2.85 gm ( 95 mmole ) in 25 ml hexane with vigorous stirring and the temperature of not above $40^{\circ} \mathrm{C}, 4 \mathrm{ml}(47$ mmole) propane-1,3-diamine was added with continuous stirring, until formaldehyde was completely dissolved. The reaction mixture was left for two days and the precipitate was filtered and dried. 1,3,7, 9,13,15 , 19,21, 25,2 7- Decaazahexa-cyclo [25.3.1. 13,7.19,13.115, 19. 121, 25] pentatria-
contane (4). The
product (3), was recrysta-llized three times from hexane to obtain a monocrystal pentamer.

## Discussion:

We obtained product (1) with a yield approaching $96 \%$ by the addition of formaldehyde to propane-1,3-diamine without solvent This product is in conformity with what Krassig suggested (Scheme 1). In mass spectrum tetramer (1) we observed the peak of molecular ion $\mathrm{M}++1$ with $\mathrm{m} / \mathrm{z} 393$ (34) of medium intensity and peaks of compatible ions, $\mathrm{N}, \mathrm{N}^{\prime}$ -bis(methylene)propane-1,3-diamine with $\mathrm{m} / \mathrm{z} 99$ (85), 98 (77), 97 (72), its dimer with $\mathrm{m} / \mathrm{z} 197$ (79) and trimer with m/z 295 (48), 293 (26).

(Scheme 1)
(Scheme 2). In its mass spectrum, we observed the peak of molecular ion $\mathrm{M}++1$ with $\mathrm{m} / \mathrm{z} 295$ (21) of medium intensity and peaks of compatible ions, $\mathrm{N}, \mathrm{N}^{\prime}$ -bis(methylene)propane-1,3-diamine with $\mathrm{m} / \mathrm{z} 99$ (51), 98 (34), 97 (34), its dimer with $\mathrm{m} / \mathrm{z} 197$ (28).

(Scheme ${ }^{\text {r }}$ )
To get dimer (3) (Scheme 3), the reaction occurred in hexane at a temperature not exceeding $40^{\circ} \mathrm{C}$. The mass spectrum of dimer (3) showed the peak of molecular ion $\mathrm{M}++1$ with $\mathrm{m} / \mathrm{z} 197$ (16) of medium intensity and peak ion with $\mathrm{m} / \mathrm{z} 99$ (66), of compatible $\mathrm{N}, \mathrm{N}^{\prime}$-bis(methylene)-propane-1,3-diamine. 1 H NMR spectra is followed by the appearance of peaks $(4 \mathrm{H}, 2 \mathrm{CCH} 2 \mathrm{C})$ at $\delta: 1.55$ (broad s$),(8 \mathrm{H}$,
$4 \mathrm{NCH} 2 \mathrm{C})$ at $\delta: 2.70$ (broad s), and $(8 \mathrm{H}, 4 \mathrm{NCH} 2 \mathrm{~N})$ at $\delta: 3.10$ (broad s) symmetrical compound and tetramer have the same 1 H NMR spectra (table 3). The products (1, 2 and 3 ) were determined by MS (table 2).

(Scheme ${ }^{r}$ )
To get the pentamer (4) (Scheme 4), the dimer (3) was recrystallized in hexane three times, and a monocrystal product was obtained. The structure of the pentamer was determined by X-ray diffraction analysis only (Fig. 1). Crystallographic parameters and a summary of data collection for structure (4) are given in (table $\varepsilon$ ); bond lengths (table 6) and valency corners (table 5).

(Scheme $\varsigma$ )

Figure 1. The molecular structure (RSA) for pentamer (4).

## Conclusions:-

1- The study of Mass spectroscopy of products of the condensation process of formaldehyde with propane-1,3-diamine showed, that the condensation products formation depend on the reaction conditions. Therefore different products such as dimer, trimer, tetramer and pentamer $\mathrm{N}, \mathrm{N}^{\prime}$-bis-(methylene)propane-1,3-diamine ( $\mathrm{CH} 2=\mathrm{NCH} 2 \mathrm{CH} 2 \mathrm{CH} 2 \mathrm{~N}=\mathrm{CH} 2$ ), were obtained.
2- Tetramer was very stable; all final products were transformed into tetramer when recrystallized in isopropyl alcohol or any solvent of high boiling point.

X-ray diffraction analysis. Crystallographic parameters and a summary of data collection for structure (4) are given in (table 4). The structure was solved by the direct method and refined by the leastsquares method in the full-matrix anisotropic approximation for all non-hydrogen atoms. The $H$ atoms were located geometrically and refined in the rider model with fixed isotropic thermal parameters (Uiso=0.082). The calculations were performed with the SHELXS86 (see Ref. 2) and SHELXS93 programs (see Ref. 3). We are grateful to Dmitry V. Albov (Department of Chemistry, Moscow State University, Russian Federation) for her assistance in carrying out X-ray diffraction analysis.
