# 7-Modular Character of The Covering group $\overline{\mathbf{S}}_{23}$ 

Ahmed Hussein Jassim<br>Math. Dept.<br>College of Science /Basrah University<br>e-mail: ahmedhussein1981@ymail.com

#### Abstract

: In this paper we find the modular characters of the covering group $\overline{\mathrm{S}}_{23}$ modulo $\mathrm{p}=7$ which can give the irreducible modular spin characters for $S_{23}$ modulo $\mathrm{p}=7$, also we give the 7 -decomposition matrix of $\bar{S}_{23}$

## Section (1)

## Introduction(1.1):

The Symmetric group $S_{n}$ has a covering group denoted by $\overline{S_{n}}$ of order $2(n!)$, the projective characters of $S_{n}$ is called the spin characters of $S_{n}$, which are the ordinary characters of $\overline{S_{n}}$ indexed by the partitions of $n$ with distinct parts.[I. Schur1911],[A.O. Morris 1962].

For $p=7$ Yaseen [A.K.Yaseen 1987] found the modular irreducible spin character of $S_{n}$, and $7 \leq n \leq 13$, for $n=14$ are found by Yaseen and Taban[A.K.Yaseen and S.A.Taban 1995], for $n=16,17$ and 18 are found by Taban[S.A.Taban 1998, 2001 and 2004 respectively], for $n=19$ by Najla'a[N.S.Abdullah 2009] for $n=20$ by Jenan [J. A. Resan 2010] and $n=21$ founded by A. H. Jassim [A. H. Jassim 2011]. Finally Nizar [N. M. Yacoob 2014] founded $n=22$.

## Preliminaries(1.2):

For any group there are three kinds of characters ordinary, modular (for a given prime $p$ ), and projective (for $S_{n}$ called spin). The decomposition matrix is the relation between the ordinary and modular characters for a given prime $p$.
The characters of $\overline{S_{n}}$ fall into two classes

1) The characters indexed by the partition of $n$
2) The characters indexed by the partition of $n$ with distinct parts spin (modular).

Character of $S_{n}$ can be written as a linear combination, with non-negative integer coefficients, of the irreducible spin (modular) characters [L. Dornhoff 1972]. Below some theorems we need to evaluate the decomposition matrix and modular spin characters for $S_{n}$ :

1. Degree of the spin character $\langle\alpha\rangle=$ $\left\langle\alpha_{1}, \ldots, \alpha_{m}\right\rangle$ is:
$\operatorname{deg}\langle\alpha\rangle=2^{\left[\frac{n-m}{2}\right]} \frac{n!}{\Pi_{i=1}^{m}\left(\alpha_{i}^{\prime}\right)} \Pi_{1 \leq i<j \leq m}\left(\alpha_{i}-\right.$
$\left.\alpha_{j}\right) /\left(\alpha_{i}+\alpha_{j}\right) \quad$ [A.O.Morris 1962],
[A.O.Morris and A. K. Yaseen 1988].
2. Let $B$ be the block of defect one and let $b$ the number of $p^{a}$-conjugate characters to the irreducible ordinary character $\chi$ of G.Then [B. M. Puttaswamaiah and J. D. Dixon 1977]:
a) There exists a positive integer number $N$ such that the irreducible ordinary characters of $G$ are lying in the block $B$ divided into two disjoint classes: $B_{1}=\left\{\chi \in B \mid b \operatorname{deg} x \equiv N \bmod p^{a}\right\}$, $B_{2}=\left\{\chi \in B \mid b \operatorname{deg} x \equiv-N \bmod p^{a}\right\}$.
b) Each coefficient of the decomposition matrix of the block $B$ is 0 or 1 .
c) If $\alpha_{1}$ and $\alpha_{2}$ are not $p$-conjugate characters and belong to the classes ( $B_{1}$ and $B_{2}$ )respectively, then they have no irreducible modular character in common
d) For every irreducible ordinary character $\chi$ in $B_{1}$, there exists

## Notation(1.3):

irreducible ordinary character $\varphi$ in $B_{2}$ such that they have one irreducible modular character in common with one multiplicity .
3. If $C$ is a principal character of $G$ for a prime $p$, then $\operatorname{deg} C \equiv 0 \bmod p^{A}$, where $\quad \mathrm{o}(G)=p^{A} m,(p, m)=1$ [S.A.Taban 1989],[J.F. Humphreys 1977].
4. If the decomposition matrix $D_{n-1, p}=$ $\left(d_{i j}\right)$ for $S_{n-1}$ is known, then we can induce columns $\left(\psi_{j} \uparrow^{(r, \bar{r})} S_{n}\right)$ for $S_{n}$ [A.K.Yaseen 1987], these columns are a linear combination with nonnegative coefficients from the columns of $D_{n, p}$ [G.D.James and A.Kerber 1981].
$(<\lambda>)^{n o} \quad(n o)$ mean the number of i.m.s. in $\langle\lambda\rangle$
i.m.s. Irreducible modular spin character.
m.s. Modular spin character.
p.i.s. Principle indecomposable spin character.
p.s. Principle spin character.

## $\underline{\text { Decomposition matrix for } S_{23} \text { modulo } p=7}$

The decomposition matrix for $S_{23}$ modulo $p=7$ of degree (156,105) [A.O.Morris 1962], [ A.O.Morris and A.K.Yaseen 1988].There are 13 blocks, the block $B_{1}$ of defect three, the blocks $B_{2} B_{3}, B_{4}$, and $B_{5}$ are of defect two, $B_{6}, B_{7}, B_{8}$, are of defect one and $B_{9}, B_{10}, \ldots$ ,$B_{13}$ are of defect zero.

## Section (2) blocks of defect one

In this section, we determine the Brauer trees of the blocks $B_{6}, B_{8}$, all i.m.s. are associate, in $B_{7}$ all i.m.s. of the decomposition matrix for this block is double [A.K. Yaseen 1987].

## Lemma (2.1):

Brauer tree for the block $B_{8}$ is:

$$
\left.\begin{array}{cc}
\langle 16,4,2,1\rangle_{\ldots}\langle 11,9,2,1\rangle_{\ldots}\langle 9,8,4,2\rangle & \vdots \\
\langle 16,4,2,1\rangle^{\prime} \ldots\langle 11,9,2,1\rangle^{\prime} \ldots\langle 9,8,4,2\rangle^{\prime}
\end{array}\right\rangle\langle 9,7,4,2,1\rangle^{*}
$$

## Proof:

- $\operatorname{deg}\left(\langle 11,9,2,1\rangle,\langle 11,9,2,1\rangle^{\prime},\langle 9,7,2,1\rangle^{*}\right) \equiv 294 \bmod 7^{3}$,
$\operatorname{deg}\left(\langle 16,4,2,1\rangle,\langle 16,4,2,1\rangle^{\prime},\langle 9,8,4,2\rangle,\langle 9,8,4,2\rangle^{\prime}\right) \equiv-294 \bmod 7^{3}$.
- By using inducing of p.i.s. for $S_{22}$ to $S_{23}$ we have on p.i.s. we have:
$D_{72} \uparrow^{(1,0)} S_{23}=d_{95}, D_{73} \uparrow^{(1,0)} S_{23}=d_{96}\left(\right.$ no sub sum of them $\equiv 0 \bmod 7^{3}$ ), and p.s.
$D_{74} \uparrow^{(1,0)} S_{23}=k_{1}, D_{75} \uparrow^{(1,0)} S_{23}=k_{2}, \quad D_{79} \uparrow^{(4,4)} S_{23}=k_{3}$.
$\langle 9,8,4,2,1\rangle$ and $\langle 9,8,4,2,1\rangle^{\prime}$ are p.i.s. of $S_{24}$ (of defect 0 in $S_{24}, p=7$ ) we have:
$\langle 9,8,4,2,1\rangle \downarrow_{(1,0)} S_{23}=\langle 9,8,4,2\rangle+\langle 9,7,4,2,1\rangle^{*}=d_{99}$
$\langle 9,8,4,2,1\rangle^{\prime} \downarrow_{(1,0)} S_{23}=\langle 9,8,4,2\rangle^{\prime}+\langle 9,7,4,2,1\rangle^{*}=d_{100}$
Since $k_{3}=k_{1}+k_{2}-d_{99}-d_{100}$, either ( $k_{1}-d_{99}$ and $k_{2}-d_{100}$ ) or $\left(k_{1}-d_{100}\right.$ and $k_{2}-d_{99}$ )are p.s. In any case we have $k_{2}, k_{3}$ are not p.i.s. so we take $d_{97}=k_{1}-d_{100}$, $d_{98}=k_{2}-d_{99}$. Hence, we have the Braure tree for this block $B_{8}$

## Lemma (2.2):

Brauer tree for the block $B_{7}$ is:

## Proof:

- $\operatorname{deg}\left(\langle 10,9,3,1\rangle,\langle 10,9,3,1\rangle^{\prime},\langle 10,7,3,2,1\rangle^{*}\right) \equiv 249 \bmod 7^{3}$,

$$
\operatorname{deg}\left(\langle 17,3,2,1\rangle,\langle 17,3,2,1\rangle^{\prime},\langle 10,8,3,2\rangle,\langle 10,8,3,2\rangle^{\prime}\right) \equiv-294 \bmod 7^{3} .
$$

- By using inducing of p.i.s. for $S_{22}$ to $S_{23}$ we have on p.i.s.:
$D_{66} \uparrow^{(1,0)} S_{23}=d_{89}, D_{97} \uparrow^{(1,0)} S_{23}=d_{90}\left(\right.$ no sub sum of them $\left.\equiv 0 \bmod 7^{3}\right)$,
and p.s.
$D_{68} \uparrow^{(1,0)} S_{23}=k_{1}, D_{69} \uparrow^{(1,0)} S_{23}=k_{2}, \quad D_{70} \uparrow^{(1,0)} S_{23}=k_{3}, D_{93} \uparrow^{(2,6)} S_{23}=k_{4}$.
Since $\langle 10,8,3,2,1\rangle$ and $\langle 10,8,3,2,1\rangle^{\prime}$ are p.i.s. of $S_{24}$ (of defect 0 in $S_{24}, p=7$ ) and:
$\langle 10,8,3,2,1\rangle \downarrow_{(1,0)} S_{23}=\langle 10,8,3,2\rangle+\langle 10,7,3,2,1\rangle^{*}=d_{93}$
$\langle 10,8,3,2,1\rangle^{\prime} \downarrow_{(1,0)} S_{23}=\langle 10,8,3,2\rangle^{\prime}+\langle 10,7,3,2,1\rangle^{*}=d_{94}$
then $k_{3}=d_{93}+d_{94}$, and since $k_{4}=k_{1}+k_{2}-d_{93}-d_{94}$, either $\left(k_{1}-d_{93}\right.$ and $\left.k_{2}-d_{94}\right)$ or $\left(k_{1}-d_{94}\right.$ and $k_{2}-d_{93}$ )are p.s. In any case, we have $k_{2}, k_{3}$ are not p.i.s. so we take $d_{91}=k_{1}-d_{94}, d_{92}=k_{2}-d_{93}$. Hence, we have the Braure tree for this block $B_{7}$

## Lemma (2.3):

Brauer tree for the block $B_{6}$ is:

$$
\langle 18,4,1\rangle^{*} \ldots \_\langle 11,8,4\rangle^{*} \_\langle 11,7,4,1\rangle=\langle 11,7,4,1\rangle^{\prime} \ldots\langle 11,5,4,2,1\rangle^{*} \text {. }
$$

## Proof:

by $(4,4)$-inducing of p.i.s $D_{9}, D_{17}, D_{23}$ of $S_{22}$ to $S_{23}$ we get on the Brauer tree of the block $B_{6}$.

## Section (3) block of defect two

In this section, the decomposition matrices for blocks $B_{2}, B_{3}$, and $B_{4}$ all i.m.s. are associate, and $B_{5}$ all i.m.s. of the decomposition matrix is double [A.K.Yaseen 1987].

## Lemma(3.1):

The decomposition matrix for the block $B_{5}$ is $D_{23,7}{ }^{5}$ (as in appendix 2).

## Proof:

By using $(r, \bar{r})$-inducing of p.i.s. for $S_{22}$ to $S_{23}$ we get:
$D_{8} \uparrow^{(3,5)} S_{23}=c_{1}, D_{11} \uparrow^{(3,5)} S_{23}=c_{2}, D_{15} \uparrow^{(3,5)} S_{23}=c_{3}, D_{48} \uparrow^{(1,0)} S_{23}=c_{4}, D_{25} \uparrow^{(3,5)} S_{23}=c_{5}$, $D_{33} \uparrow^{(3,5)} S_{23}=c_{6}, D_{35} \uparrow^{(3,5)} S_{23}=c_{7}, D_{37} \uparrow^{(3,5)} S_{23}=c_{8}, D_{43} \uparrow^{(3,5)} S_{23}=c_{9}$.

Now, on (7, $\alpha$ )-regular classes we have:

1) $\langle 14,5,3,1\rangle=\langle 14,5,3,1\rangle^{\prime}$.
2) $\langle 12,7,3,1\rangle=\langle 12,7,3,1\rangle^{\prime}$.
3) $\langle 10,7,5,1\rangle=\langle 10,7,5,1\rangle^{\prime}$.
4) $\langle 8,7,5,3\rangle=\langle 8,7,5,3\rangle^{\prime}$.
5) $\langle 10,5,4,3,1\rangle^{*}=\langle 10,7,5,1\rangle+\langle 17,5,1\rangle^{*}-\langle 10,8,5\rangle^{*}-\langle 12,10,1\rangle^{*}$.
6) $\langle 8,6,5,31\rangle^{*}=\langle 8,7,5,3\rangle+\langle 10,8,5\rangle-\langle 12,8,3\rangle^{*}+\langle 15,5,3\rangle+\langle 19,3.1\rangle$.
7) $\langle 14,5,3,1\rangle=\langle 12,7,3,1\rangle-\langle 10,7,5,1\rangle+\langle 8,7,5,3\rangle$.
8) $\langle 8,7,5,3\rangle=\langle 10,7,5,1\rangle-\langle 12,7,3,1\rangle+\langle 14,5,3,1\rangle$.

Approximation matrix contains at most 9 columns since there are 8 equations corresponding to the spin characters of $S_{23}$ in $B_{5}$ [A.K.Yaseen 1987], and Since $c_{1}, \ldots, c_{9}$ are linearly independent, $c_{i}$ $-\mathrm{c}_{\mathrm{j}}$ is not p.s to $\mathrm{S}_{23}$ for all $1 \leq \mathrm{i}<\mathrm{j} \leq 9$ then we get the decomposition matrix for $B_{5}$

## Lemma(3.2):

The decomposition matrix for the block $B_{4}$ is $D_{23,7}^{4}$ (as in appendix 2).

## Proof:

By using $(r, \bar{r})$-inducing of p.i.s. for $S_{22}$ to $S_{23}$ we get:

$$
\begin{array}{lccc}
D_{45} \uparrow^{(4,4)} S_{23}=k_{1}, & D_{46} \uparrow^{(4,4)} S_{23}=k_{2}, & D_{84} \uparrow^{(1,0)} S_{23}=c_{5}, & D_{85} \uparrow^{(1,0)} S_{23}=c_{6}, \\
D_{48} \uparrow^{(4,4)} S_{23}=k_{3}, & D_{49} \uparrow^{(4,4)} S_{23}=k_{4}, & D_{86} \uparrow^{(1,0)} S_{23}=c_{11}, & D_{87} \uparrow^{(1,0)} S_{23}=c_{12}, \\
D_{51} \uparrow^{(4,4)} S_{23}=k_{5}, & D_{88} \uparrow^{(1,0)} S_{23}=c_{15}, & D_{89} \uparrow^{(1,0)} S_{23}=c_{16}, & D_{53} \uparrow^{(4,4)} S_{23}=k_{6} .
\end{array}
$$

| $\langle 8,6,5,4\rangle$ |  |  |  |  |  | 2 |  |  |  | 1 | 1 | 1 | n |  |
| $\langle 8,6,5,4\rangle^{\prime}$ |  |  |  |  |  | 2 |  |  |  | 1 | 1 | 1 |  | n |
| $\langle 7,6,5,4,1\rangle^{*}$ |  |  |  |  |  |  |  |  |  | 1 | 1 |  | z | z |
|  | $k_{1}$ | $k_{2}$ | $c_{5}$ | $c_{6}$ | $k_{3}$ | $k_{4}$ | $c_{11}$ | $c_{12}$ | $k_{5}$ | $c_{15}$ | $c_{16}$ | $k_{6}$ | $Y_{1}$ | $Y_{2}$ |

On (7, $\alpha$ )-regular classes we have:

1) $\langle 12,7,4\rangle^{*}=\langle 19,4\rangle+\langle 19,4\rangle^{\prime}+\langle 12,6,4,1\rangle+\langle 12,6,4,1\rangle^{\prime}+\langle 12,11\rangle+\langle 12,11\rangle^{\prime}-\langle 12,5,4,2\rangle-$ $\langle 12,5,4,2\rangle^{\prime}$.
2) $\langle 11,7,5\rangle^{*}=\langle 18,5\rangle+\langle 18,5\rangle^{\prime}+\langle 11,6,5,1\rangle+\langle 11,6,5,1\rangle^{\prime}-\langle 11,5,4,3\rangle-\langle 11,5,4,3\rangle^{\prime}-$ $\langle 12,11\rangle-\langle 12,11\rangle^{\prime}$.
3) $\langle 14,5,4\rangle^{*}=\langle 12,7,4\rangle^{*}+\langle 7,6,5,4,1\rangle^{*}-\langle 11,7,5\rangle^{*}$.
4) $\langle 7,6,5,4,1\rangle^{*}=\langle 11,6,5,1\rangle+\langle 11,6,5,1\rangle^{\prime}+\langle 18,5\rangle+\langle 18,5\rangle^{\prime}+\langle 14,5,4\rangle^{*}-\langle 12,7,4\rangle^{*}-$ $\langle 11,5,4,3\rangle-\langle 11,5,4,3\rangle^{\prime}-\langle 12,11\rangle-\langle 12,11\rangle^{\prime}$.

So, there are 18 columns to the spin characters of $S_{23}$ in $B_{4}$.
Since $\langle 19,4\rangle \neq\langle 19,4\rangle^{\prime}$ on $(7, \alpha)$-regular classes then $k_{1}$ is split or there are two columns.
Suppose there are two columns such as $Y_{1}$ and $Y_{2}$ (table (2)). To describe columns $Y_{1}$ and $Y_{2}$ :

1. $\langle 19,4\rangle \downarrow S_{22}=\left(\langle 18,4\rangle^{*}\right)^{1}+\left(\langle 19,3\rangle^{*}\right)^{1}$ has 2 of i.m.s.(see appendix 1) so we have $a \in\{0,1\}$.
2. $\langle 18,5\rangle \downarrow S_{22}=\left(\langle 17,5\rangle^{*}\right)^{2}+\left(\langle 18,4\rangle^{*}\right)^{1}$ has 3 of i.m.s. so we have $b \in\{0,1\}$.
3. $\langle 14,5,4\rangle^{*} \downarrow S_{22}=(\langle 13,5,4\rangle)^{1}+\left(\langle 13,5,4\rangle^{\prime}\right)^{1}+(\langle 14,5,3\rangle)^{2}+\left(\langle 14,5,3\rangle^{\prime}\right)^{2}$ has 6 of i.m.s. we have $c \in\{0,1\}$, if $c=2$ so we have a contradiction.
4. $\langle 13,5,4,1\rangle \downarrow S_{22}=\left(\langle 12,5,4,1\rangle^{*}\right)^{1}+\left(\langle 13,5,3,1\rangle^{*}\right)^{2}+(\langle 13,5,4\rangle)^{1}$ has 4 of i.m.s. so we have $d \in\{0,1,2\}$.
5. $\langle 12,7,4\rangle^{*} \downarrow S_{22}=(\langle 11,7,4\rangle)^{2}+\left(\langle 11,7,4\rangle^{\prime}\right)^{2}+(\langle 12,6,4\rangle)^{2}+\left(\langle 12,6,4\rangle^{\prime}\right)^{2}+$ $(\langle 12,7,3\rangle)^{5}+\left(\langle 12,7,3\rangle^{\prime}\right)^{5}$ has 18 of i.m.s. so we have $f \in\{0,1, \ldots, 4\}$.
6. $\langle 12,6,4,1\rangle \downarrow S_{22}=\left(\langle 11,6,4,1\rangle^{*}\right)^{2}+\left(\langle 12,5,4,1\rangle^{*}\right)^{1}+\left(\langle 12,6,3,1\rangle^{*}\right)^{4}+(\langle 12,6,4\rangle)^{2}$ has 9 of i.m.s. so we have $g \in\{0,1, \ldots, 5\}$.
7. $\langle 12,5,4,2\rangle \downarrow S_{22}=\left(\langle 11,5,4,2\rangle^{*}\right)^{1}+\left(\langle 12,5,3,2\rangle^{*}\right)^{2}+\left(\langle 12,5,4,1\rangle^{*}\right)^{1}$ has 4 of i.m.s. so we have $h \in\{0,1,2\}$.
8. $\langle 11,7,5\rangle^{*} \downarrow S_{22}=(\langle 10,7,5\rangle)^{4}+\left(\langle 10,7,5\rangle^{\prime}\right)^{4}+(\langle 11,6,5\rangle)^{2}+\left(\langle 11,6,5\rangle^{\prime}\right)^{2}+$ $(\langle 11,7,4\rangle)^{2}+\left(\langle 11,7,4\rangle^{\prime}\right)^{2}$ has 16 of i.m.s. so we have $i \in\{0,1, \ldots, 4\}$.
9. $\langle 11,6,5,1\rangle \downarrow S_{22}=\left(\langle 10,6,5,1\rangle^{*}\right)^{6}+\left(\langle 11,6,4,1\rangle^{*}\right)^{2}+(\langle 11,6,5\rangle)^{2}$ has 10 of i.m.s. so we have $j \in\{0,1, \ldots, 4\}$.
10. $\langle 11,5,4,3\rangle \downarrow S_{22}=\left(\langle 10,5,4,3\rangle^{*}\right)^{2}+\left(\langle 11,5,4,2\rangle^{*}\right)^{1}$ has 3 of i.m.s. so we have $m \in\{0,1\}$.
11. $\langle 8,6,5,4\rangle \downarrow S_{22}=\left(\langle 7,6,5,4\rangle^{*}\right)^{2}+\left(\langle 8,6,5,3\rangle^{*}\right)^{5}$ has 7 of i.m.s. so we have $n \in\{0,1,2\}$.
12. $\langle 7,6,5,4,1\rangle^{*} \downarrow S_{22}=(\langle 7,6,5,3,1\rangle)^{1}+\left(\langle 7,6,5,3,1\rangle^{\prime}\right)^{1}+\left(\langle 7,6,5,4\rangle^{*}\right)^{2}$ has 4 of i.m.s. so we have $z \in\{0,1\}$.

Take $a=1$, since the restriction of the following intersections:
$\langle 19,4\rangle \downarrow S_{22} \cap\langle 14,5,4\rangle^{*} \downarrow S_{22}, \quad\langle 19,4\rangle \downarrow S_{22} \cap\langle 13,5,4,1\rangle \downarrow S_{22}, \quad\langle 19,4\rangle \downarrow S_{22} \cap\langle 12,6,4,1\rangle \downarrow S_{22}$, $\langle 19,4\rangle \downarrow S_{22} \cap\langle 12,5,4,2\rangle \downarrow S_{22},\langle 19,4\rangle \downarrow S_{22} \cap\langle 11,6,5,1\rangle \downarrow S_{22},\langle 19,4\rangle \downarrow S_{22} \cap\langle 11,5,4,3\rangle \downarrow S_{22}$,
$\langle 19,4\rangle \downarrow S_{22} \cap\langle 8,6,5,4\rangle \downarrow S_{22}$ and $\langle 19,4\rangle \downarrow S_{22} \cap\langle 7,6,5,4,1\rangle \downarrow S_{22}$, has no i.m.s in the intersections, so we have $c=d=g=h=j=m=n=z=0$.

- $\langle 19,4\rangle \downarrow S_{22} \cap\langle 18,5\rangle \downarrow S_{22}$ has 2 of i.m.s for $S_{22}$

$$
\begin{array}{rlrl}
\therefore\langle 19,4\rangle \cap\langle 18,5\rangle & =\Psi_{1}+\varphi_{1} & \text { if } b=1, \\
& =\Psi_{1} & & \text { if } b=0 .
\end{array}
$$

- $\langle 19,4\rangle \downarrow S_{22} \cap\langle 12,7,4\rangle^{*} \downarrow S_{22}$ has 2 of i.m.s for $S_{22}$

$$
\begin{aligned}
\therefore\langle 19,4\rangle \cap\langle 12,7,4\rangle^{*} & =\Psi_{1}+\varphi_{1} & & \text { if } f \in\{1,2,3,4\}, \\
& =\Psi_{1} & & \text { if } f=0 .
\end{aligned}
$$

- $\langle 19,4\rangle \downarrow S_{22} \cap\langle 11,7,5\rangle^{*} \downarrow S_{22}$ has 2 of i.m.s for $S_{22}$
$\therefore\langle 19,4\rangle \cap\langle 11,7,5\rangle^{*}=\Psi_{1}+\varphi_{1} \quad$ if $i \in\{1,2,3,4\}$, $=\Psi_{1} \quad$ if $i=0$.

Then, we have:
$\left.\left.Y_{1}=\langle 19,4\rangle+b\langle 18,5\rangle+f\langle 12,7,4\rangle^{*}+i<11,7,5\right\rangle^{*} ; Y_{2}=\langle 19,4\rangle^{\prime}+b\langle 18,5\rangle^{\prime}+f<12,7,4\right\rangle^{*}+$ $i<11,7,5>^{*}$; such that $\mathrm{b} \in\{0,1\}, \mathrm{f} \in\{0,1,2,3,4\}, \mathrm{i} \in\{0,1,2,3,4\}$.

Since inducing m.s. is m.s. [J. F. Humphreys 1977], so we have

- $\left(\langle 17,5\rangle^{*}-\langle 19,3\rangle^{*}\right) \uparrow^{(4,4)} S_{23}=\langle 18,5\rangle+\langle 18,5\rangle^{\prime}-\langle 19,4\rangle-\langle 19,4\rangle^{\prime}$,
$\therefore b \geq a \Rightarrow b=a=1$ $\qquad$ (3.1).
- $\left(\langle 12,7,3\rangle-\langle 19,3\rangle^{*}\right) \uparrow^{(4,4)} S_{23}=\langle 12,7\rangle-\langle 19,4\rangle-\langle 19,4\rangle^{\prime}$, $\therefore f \geq a$ .(3.2).
- $\left(\langle 19,3\rangle^{*}-\langle 12,7,3\rangle+\langle 12,10\rangle^{*}+\langle 12,6,3,1\rangle^{*}\right) \uparrow^{(4,4)} S_{23}=\langle 19,4\rangle+\langle 19,4\rangle^{\prime}-\langle 12,7,4\rangle^{*}+$ $\langle 12,11\rangle+\langle 12,11\rangle^{\prime}+\langle 12,6,4\rangle+\langle 12,6,4\rangle^{\prime}$,
$\therefore a \geq f$ ..(3.3).
$\Rightarrow f=a=1$ (3.4) $($ from $(3.2) \&(3.3))$.
- $\left(\langle 19,3\rangle^{*}-\langle 10,7,5\rangle+\langle 10,6,5,1\rangle^{*}\right) \uparrow^{(4,4)} S_{23}=\langle 19,4\rangle+\langle 19,4\rangle^{\prime}-\langle 11,7,5\rangle^{*}+\langle 11,6,5,1\rangle+$ $\langle 11,6,5,1\rangle^{\prime}$,
$\therefore a \geq i \Rightarrow i=a=1$ .(3.5),

From (3.1), (3.4), and (3.5) we get on $a=b=f=i=1$ so $k_{1}$ splits.
Since $\langle 18,5\rangle \neq\langle 18,5\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then either $k_{2}$ is split or there are two columns, we take $b=1(a=0)$ and since:

$$
\begin{aligned}
& \langle 18,5\rangle \downarrow S_{22} \cap\langle 13,5,4,1\rangle \downarrow S_{22}, \quad\langle 18,5\rangle \downarrow S_{22} \cap\langle 12,6,4,1\rangle \downarrow S_{22}, \quad\langle 18,5\rangle \downarrow S_{22} \cap\langle 12,5,4,2\rangle \downarrow S_{22}, \\
& \langle 18,5\rangle \downarrow S_{22} \cap\langle 11,6,5,1\rangle \downarrow S_{22},\langle 18,5\rangle \downarrow S_{22} \cap\langle 11,5,4,3\rangle \downarrow S_{22},\langle 18,5\rangle \downarrow S_{22} \cap\langle 8,6,5,4\rangle \downarrow S_{22}
\end{aligned}
$$

and $\langle 18,5\rangle \downarrow S_{22} \cap\langle 7,6,5,4,1\rangle^{*} \downarrow S_{22}$, has no i.m.s in the intersections, so we have $d=g=h=j=$ $m=n=z=0$, then we have:
$\left.Y_{1}=\langle 18,5\rangle+c\langle 14,5,4\rangle^{*}+f\langle 12,7,4\rangle^{*}+i<11,7,5\right\rangle^{*} ; Y_{2}=\langle 18,4\rangle^{\prime}+c\langle 14,5,4\rangle^{*}+$ $f<12,7,4>^{*}+i<11,7,5>^{*}$; such that $\mathrm{c} \in\{0,1\}, \mathrm{f} \in\{0,1,2,3,4\}$, and $\mathrm{i} \in\{0,1,2,3,4\}$,

And same discussion, we have on $b=c=f=1$, so we have:
$\mathrm{Y}_{1}=\langle 18,4\rangle+\langle 14,5,4\rangle^{*}+\langle 12,7,4\rangle^{*}+i\langle 11,7,5\rangle^{*}, \mathrm{Y}_{2}=\langle 18,4\rangle^{\prime}+\langle 14,5,4\rangle^{*}+\langle 12,7,4\rangle^{*} i\langle 11,7,5\rangle^{*}$ which is not p.s. since $\operatorname{deg} Y_{1} \not \equiv 0 \bmod 7^{3}$ and deg $Y_{2} \not \equiv 0 \bmod 7^{3}, \forall i \in\{0,1, \ldots, 4\}$, so $\boldsymbol{k}_{\mathbf{2}}$ splits.

Since $\langle 12,11\rangle \neq\langle 12,11\rangle^{\prime}$ on $(7, \alpha)$ - regular classes and since
$\langle 12,11\rangle \downarrow S_{22}=\left(\langle 12,10\rangle^{*}\right)^{2}$ and from table(2) then $k_{4}$ must splits .
Since $\langle 12,5,4,2\rangle \neq\langle 12,5,4,2\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{3}$ or $k_{5}$ splits or there are another two columns.

Suppose there are other two columns $Y_{1}, Y_{2}$ see table (1).
Let $h \in\{1,2\}$ and same discussion we have on $h=d=g$, then $k_{3}$ is splits.
the second probability leads to the first probability then either $k_{3}$ or $k_{5}$ splits suppose $k_{5}$ splits, since $\langle 11,5,4,3\rangle \neq\langle 11,5,4,3\rangle^{\prime}$ on (7, $\alpha$ )- regular classes then $k_{6}$ splits or there are other two columns but $\langle 8,6,5,4\rangle \neq\langle 8,6,5,4\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then either $k_{6}$ splits or there are other two columns these in two cases we get contradiction.

If $k_{6}$ splits and $\langle 8,6,5,4\rangle \neq\langle 8,6,5,4\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then we must find another two columns so we have contradiction, then $k_{3}$ must is splits.

Since $\langle 11,5,4,3\rangle \neq\langle 11,5,4,3\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{5}$ or $k_{6}$ splits or there are other two columns.

Suppose there are two columns. Let $m=1$ and same discussion we have on $n=j=m$. then $k_{6}$ splits. Since $\langle 8,6,5,4\rangle \neq\langle 8,6,5,4\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then so $k_{5}$ must splits so we get the decomposition matrix for $B_{4}$

## Lemma(3.3):

Decomposition matrix for the block $B_{3}$ is $D_{23,7}{ }^{3}$ (as in appendix 2).

## Proof:

By using ( $r, \bar{r}$ )-inducing of p.i.s. for $S_{22}$ to $S_{23}$ we get:
$D_{45} \uparrow^{(6,2)} S_{23}=k_{1}, \quad D_{46} \uparrow^{(6,2)} S_{23}=k_{2}, \quad D_{90} \uparrow^{(1,0)} S_{23}=c_{5}, \quad D_{91} \uparrow^{(1,0)} S_{23}=c_{6}$,
$D_{49} \uparrow^{(6,2)} S_{23}=k_{3}, \quad D_{50} \uparrow^{(6,2)} S_{23}=k_{4}, \quad D_{59} \uparrow^{(5,3)} S_{23}=k_{5}, \quad D_{60} \uparrow^{(5,3)} S_{23}=k_{6}$,
$D_{52} \uparrow^{(6,2)} S_{23}=k_{7}, \quad D_{53} \uparrow^{(6,2)} S_{23}=k_{8}$.
Table(3)

Now, on (7, $\alpha$ )-regular classes we have:

1) $\langle 7,6,5,3,2\rangle^{*}=\langle 10,7,6\rangle^{*}-\langle 13,7,3\rangle^{*}+\langle 14,6,3\rangle^{*}$;
2) $\langle 10,7,6\rangle^{*}=\langle 10,6,5,2\rangle+\langle 10,6,5,2\rangle^{\prime}-\langle 10,6,4,3\rangle-\langle 10,6,4,3\rangle^{\prime}-\langle 13,10\rangle-\langle 13,10\rangle^{\prime}+$ $\langle 17,6\rangle+\langle 17,6\rangle^{\prime} ;$
3) $\langle 13,7,3\rangle^{*}=\langle 13,6,3\rangle+\langle 13,6,3\rangle^{\prime}+\langle 13,10\rangle+\langle 13,10\rangle^{\prime}+\langle 20,3\rangle+\langle 20,3\rangle^{\prime}-\langle 13,5,3,2\rangle-$ $\langle 13,5,3,2\rangle^{\prime}$ and,
4) $\langle 14,6,3\rangle^{*}=\langle 13,10\rangle+\langle 13,10\rangle^{\prime}+\langle 13,6,3,1\rangle+\langle 13,6,3,1\rangle^{\prime}-\langle 13,5,3,2\rangle-\langle 13,5,3,2\rangle^{\prime}-$ $\langle 10,7,4\rangle^{*}+\langle 20,3\rangle+\langle 20,3\rangle^{\prime}$.

So there are 18 columns to the spin characters of $S_{23}$ in $B_{3}$.
Since $\langle 20,3\rangle \neq\langle 20,3\rangle^{\prime}$ on $(7, \alpha)$-regular classes then $k_{1}$ is split or there are two columns.
Suppose there are two columns such as $Y_{1}$ and $Y_{2}$ (Table (3)). To describe columns $Y_{1}$ and $Y_{2}$ :

1. $\langle 20,3\rangle \downarrow S_{22}=\left(\langle 19,3\rangle^{*}\right)^{1}+\left(\langle 20,2\rangle^{*}\right)^{1}$ has 2 of i.m.s.(see appendix 1) so we have $a \in\{0,1\}$.
2. $\langle 17,6\rangle \downarrow S_{22}=\left(\langle 16,6\rangle^{*}\right)^{2}+\left(\langle 17,5\rangle^{*}\right)^{2}$ has 4 of i.m.s. so we have $b \in\{0,1,2\}$.
3. $\langle 14,6,3\rangle^{*} \downarrow S_{22}=(\langle 13,6,3\rangle)^{1}+\left(\langle 13,6,3\rangle^{\prime}\right)^{1}+(\langle 14,5,3\rangle)^{2}+\left(\langle 14,5,3\rangle^{\prime}\right)^{2}+$ $(\langle 14,6,2\rangle)^{2}+\left(\langle 14,6,2\rangle^{\prime}\right)^{2}$ has 10 of i.m.s. we have $c \in\{0,1,2,3\}$.
4. $\langle 13,10\rangle \downarrow S_{22}=\left(\langle 12,10\rangle^{*}\right)^{2}+\left(\langle 13,9\rangle^{*}\right)^{2}$ has 4 of i.m.s. so we have $d \in\{0,1,2\}$.
5. $\langle 13,7,3\rangle^{*} \downarrow S_{22}=(\langle 12,7,3\rangle)^{5}+\left(\langle 12,7,3\rangle^{\prime}\right)^{5}+(\langle 13,6,3\rangle)^{1}+\left(\langle 13,6,3\rangle^{\prime}\right)^{1}+$ $(\langle 13,7,2\rangle)^{5}+\left(\langle 13,7,2\rangle^{\prime}\right)^{5}$ has 22 of i.m.s. so we have $e \in\{0,1, \ldots, 6\}$.
6. $\langle 13,6,3,1\rangle \downarrow S_{22}=\left(\langle 12,6,3,1\rangle^{*}\right)^{4}+\left(\langle 13,5,3,1\rangle^{*}\right)^{2}+\left(\langle 13,6,2,1\rangle^{*}\right)^{3}+(\langle 13,6,3\rangle)^{1}$ has 10 of i.m.s. so we have $f \in\{0,1, \ldots, 7\}$.
7. $\langle 13,5,3,2\rangle \downarrow S_{22}=\left(\langle 12,5,3,2\rangle^{*}\right)^{2}+\left(\langle 13,4,3,2\rangle^{*}\right)^{1}+\left(\langle 13,5,3,1\rangle^{*}\right)^{2}$ has 5 of i.m.s. so we have $g \in\{0,1,2,3,4\}$.
8. $\langle 12,6,3,2\rangle \downarrow S_{22}=\left(\langle 11,6,3,2\rangle^{*}\right)^{3}+\left(\langle 12,5,3,2\rangle^{*}\right)^{2}+(\langle 12,6,3,1\rangle)^{4}$ has 9 of i.m.s. so we have $h \in\{0,1, \ldots, 6\}$.
9. $\langle 10,7,6\rangle^{*} \downarrow S_{22}=(\langle 9,7,6\rangle)^{4}+\left(\langle 9,7,6\rangle^{\prime}\right)^{4}+(\langle 10,7,5\rangle)^{4}+\left(\langle 10,7,5\rangle^{\prime}\right)^{4}$ has 16 of i.m.s. so we have $i \in\{0,1,2, \ldots, 4\}$.
10. $\langle 10,6,5,2\rangle \downarrow S_{22}=\left(\langle 9,6,5,2\rangle^{*}\right)^{6}+\left(\langle 10,6,4,2\rangle^{*}\right)^{3}+\left(\langle 10,6,5,1\rangle^{*}\right)^{6}$ has 15 of i.m.s. so we have $j \in\{0,1,2, \ldots, 9\}$.
11. $\langle 10,6,4,3\rangle \downarrow S_{22}=\left(\langle 9,6,4,3\rangle^{*}\right)^{2}+\left(\langle 10,5,4,3\rangle^{*}\right)^{2}+\left(\langle 10,6,4,2\rangle^{*}\right)^{3}$ has 7 of i.m.s. so we have $m \in\{0,1,2, \ldots, 5\}$.
12. $\langle 9,6,5,3\rangle \downarrow S_{22}=\left(\langle 8,6,5,3\rangle^{*}\right)^{5}+\left(\langle 9,6,4,3\rangle^{*}\right)^{2}+\left(\langle 9,6,5,2\rangle^{*}\right)^{6}$ has 13 of i.m.s. so we have $n \in\{0,1,2, \ldots, 8\}$.
13. $\langle 7,6,5,3,2\rangle^{*} \downarrow S_{22}=$ $(\langle 7,6,4,3,2\rangle)^{1}+\left(\langle 7,6,4,3,2\rangle^{\prime}\right)^{1}+(\langle 7,6,5,3,1\rangle)^{1}+\left(\langle 7,6,5,3,1\rangle^{\prime}\right)^{1}$ has 4 of i.m.s. so we have $z \in\{0,1\}$.

Take $a=1$, and since :
$\langle 20,3\rangle \downarrow S_{22} \cap\langle 14,6,3\rangle^{*} \downarrow S_{22}, \quad\langle 20,3\rangle \downarrow S_{22} \cap\langle 13,10\rangle \downarrow S_{22}, \quad\langle 20,3\rangle \downarrow S_{22} \cap\langle 13,6,3,1\rangle \downarrow S_{22}$, $\langle 20,3\rangle \downarrow S_{22} \cap\langle 13,5,3,2\rangle \downarrow S_{22},\langle 20,3\rangle \downarrow S_{22} \cap\langle 12,6,3,2\rangle \downarrow S_{22},\langle 20,3\rangle \downarrow S_{22} \cap\langle 10,6,5,2\rangle \downarrow S_{22}$,
$\langle 20,3\rangle \downarrow S_{22} \cap\langle 10,6,4,3\rangle \downarrow S_{22},\langle 20,3\rangle \downarrow S_{22} \cap\langle 9,6,5,3\rangle \downarrow S_{22}$ and, $\langle 20,3\rangle \downarrow S_{22} \cap\langle 7,6,5,3,2\rangle^{*} \downarrow S_{22}$,
has no i.m.s in the intersections, so we have $c=d=f=g=h=j=m=n=z=0$, then have:
$Y_{1}=\langle 20,3\rangle+b\langle 17,6\rangle+e\langle 13,7,3\rangle^{*}+i\langle 10,7,6\rangle^{*} ;$
$\left.\left.Y_{2}=\langle 20,3\rangle^{\prime}+b\langle 17,6\rangle^{\prime}+e<13,7,3\right\rangle^{*}+i<10,7,6\right\rangle^{*} ;$
such that $\mathrm{b} \in\{0,1,2\}, \mathrm{e} \in\{0,1,2, \ldots, 6\}, \mathrm{i} \in\{0,1,2,3,4\}$,
and same discussion we have on $a=b=e=i=1$, so $k_{1}$ splits .
Since $\langle 17,6\rangle \neq\langle 17,6\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then either $k_{2}$ is split or there are two columns, we take $b \in\{1,2\}$ and Since:
$\langle 17,6\rangle \downarrow S_{22} \cap\langle 13,6,3,1\rangle \downarrow S_{22}, \quad\langle 17,6\rangle \downarrow S_{22} \cap\langle 13,5,3,2\rangle \downarrow S_{22}, \quad\langle 17,6\rangle \downarrow S_{22} \cap\langle 12,6,3,2\rangle \downarrow S_{22}$, $\langle 17,6\rangle \downarrow S_{22} \cap\langle 10,6,5,2\rangle \downarrow S_{22},\langle 17,6\rangle \downarrow S_{22} \cap\langle 10,6,4,3\rangle \downarrow S_{22},\langle 17,6\rangle \downarrow S_{22} \cap\langle 9,6,5,3\rangle \downarrow S_{22}$
and $\langle 17,6\rangle \downarrow S_{22} \cap\langle 7,6,5,3,2\rangle^{*} \downarrow S_{22}$, has no i.m.s in the intersections, so we have $f=g=h=j=$ $m=n=z=0$, so we have:
$\left.Y_{1}=b\langle 17,6\rangle+\mathrm{c}\langle 14,6,3\rangle^{*}+\mathrm{d}\langle 13,10\rangle+e\langle 13,7,3\rangle^{*}+i<10,7,6\right\rangle^{*} ;$
$Y_{2}=b\langle 17,6\rangle^{\prime}+\mathrm{c}\langle 14,6,3\rangle^{*}+d\langle 13,10\rangle^{\prime}+e\langle 13,7,3\rangle^{*}+i\langle 10,7,6\rangle^{*} ;$
such that $\mathrm{b} \in\{1,2\}, \mathrm{c} \in\{0,1,2,3\}, \mathrm{d} \in\{0,1,2\}, \mathrm{e} \in\{0,1, \ldots, 6\}$ and $\mathrm{i} \in\{0,1, \ldots, 4\}$,
and same discussion we have on $b=c=d=e$ and $i \in\{0,1,2\}$.
But $\operatorname{deg} \mathrm{Y}_{1} \equiv 0 \bmod 7^{3}$ and $\operatorname{deg} \mathrm{Y}_{2} \equiv 0 \bmod 7^{3}$ only when $c=d=e=b$ and $i=0$, so $k_{2}$ splits.
Since $\langle 13,10\rangle \neq\langle 13,10\rangle^{\prime}$ on ( $7, \alpha$ )- regular classes then either $k_{3}$ is split or there are two columns, we take $d \in\{1,2\}$ and since:
$\langle 13,10\rangle \downarrow S_{22} \cap\langle 13,6,3,1\rangle \downarrow S_{22},\langle 13,10\rangle \downarrow S_{22} \cap\langle 13,5,3,2\rangle \downarrow S_{22},\langle 13,10\rangle \downarrow S_{22} \cap\langle 12,6,3,2\rangle \downarrow S_{22}$, $\langle 13,10\rangle \downarrow S_{22} \cap\langle 10,6,4,3\rangle \downarrow S_{22}$, and $\langle 13,10\rangle \downarrow S_{22} \cap\langle 7,6,5,3,2\rangle^{*} \downarrow S_{22}$,

Has no i.m.s in the intersections so we have $f=g=h=m=z=0$.
So we have:
$Y_{1}=\mathrm{c}\langle 14,6,3\rangle^{*}+\mathrm{d}\langle 13,10\rangle+e\langle 13,7,3\rangle^{*}+i\langle 10,7,6\rangle^{*}+\mathrm{j}\langle 10,6,5,2\rangle+\mathrm{n}\langle 9,6,5,3\rangle ;$
$\left.Y_{2}=\mathrm{c}\langle 14,6,3\rangle^{*}+\mathrm{d}\langle 13,10\rangle^{\prime}+e\langle 13,7,3\rangle^{*}+i<10,7,6\right\rangle^{*}+\mathrm{j}\langle 10,6,5,2\rangle^{\prime}+\mathrm{n}\langle 9,6,5,3\rangle^{\prime} ;$
such that $\mathrm{c} \in\{0,1,2,3\}, \mathrm{d} \in\{1,2\}, \mathrm{e} \in\{0,1, \ldots, 6\}, \mathrm{i} \in\{0,1, \ldots, 4\}, \mathrm{j} \in\{0,1, \ldots, 9\}$ and $\mathrm{i} \in\{0,1, \ldots, 4\}$.
and same discussion we have on $d=e=i, c \in\{0,1,2\}, j \in\{2,4\}, n=j$.
But the $\operatorname{deg} \mathrm{Y}_{1} \equiv 0 \bmod 7^{3}$ and $\operatorname{deg} \mathrm{Y}_{2} \equiv 0 \bmod 7^{3}$ only when $c=0, d=e=i=1$ and $i=n=$ 2 , or $c=0, d=e=i=2$ and $i=n=4$ so $k_{3}$ splits.

Since $\langle 13,5,3,2\rangle \neq\langle 13,5,3,2\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{5}$ splits or there are other two columns.

Suppose there are two columns, we take $g \in\{1,2,3,4\}$ and same discussion we have on $g=h=$ $f$ then $k_{5}$ splits.

Since $\langle 13,6,3,1\rangle \neq\langle 13,6,3,1\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{4}$ splits or there are other two columns.

Suppose there are two columns, and we take $f \in\{1,2, \ldots, 7\}$ and same discussion we have on $e=h=i=j=f$, then $k_{4}$ splits.

Since $\langle 12,6,3,2\rangle \neq\langle 12,6,3,2\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{6}$ splits or there are other two columns.

Suppose there are two columns, and we take $h \in\{1,2, \ldots, 6\}$, and we get $\operatorname{deg} Y_{1} \not \equiv 0 \bmod 7^{3}$ and $\operatorname{deg}$ $\mathrm{Y}_{2} \not \equiv 0 \bmod ^{3}$ when $i \neq 0$ and same discussion we have on $m=j=h$, then $k_{6}$ splits.

Since $\langle 10,6,4,3\rangle \neq\langle 10,6,4,3\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then $k_{8}$ splits or there are other two columns.

Suppose there are two columns,
$Y_{1}=j\langle 10,6,5,2\rangle++m\langle 10,6,4,3\rangle+n\langle 9,6,5,3\rangle ;$
$Y_{2}=j\langle 10,6,5,2\rangle^{\prime}+m\langle 10,6,4,3\rangle^{\prime}+n\langle 9,6,5,3\rangle^{\prime} ;$
such that $j \in\{0,1, \ldots, 9\}, m \in\{1,2, \ldots, 5\}$, and $n \in\{0,1, \ldots, 8\}$.
Let $m \in\{1,2, \ldots, 5\}$, and since:

- $\left(\langle 9,6,5,2\rangle^{*}-\langle 9,6,4,3\rangle^{*}+\langle 7,6,4,3,2\rangle\right) \uparrow^{(5,3)} S_{23}=\langle 10,6,5,2\rangle+\langle 10,6,5,2\rangle^{\prime}+\langle 9,6,5,3\rangle+$ $\langle 9,6,5,3\rangle^{\prime}-\langle 10,6,4,3\rangle-\langle 10,6,4,3\rangle^{\prime}-\langle 9,6,5,3\rangle-\langle 9,6,5,3\rangle^{\prime}+\langle 7,6,5,3,2\rangle^{*}$, $\therefore j \geq m$
- $\left(\langle 9,6,4,3\rangle^{*}+\langle 7,6,4,3,2\rangle-\langle 9,6,5,2\rangle^{*}+\langle 13,7,2\rangle+\langle 13,9\rangle^{*}\right) \uparrow^{(5,3)} S_{23}=\langle 10,6,4,3\rangle+$ $\langle 10,6,4,3\rangle^{\prime}+\langle 9,6,5,3\rangle+\langle 9,6,5,3\rangle^{\prime}+\langle 7,6,5,3,2\rangle^{\prime}-\langle 10,6,5,2\rangle-\langle 10,6,5,2\rangle^{\prime}-\langle 9,6,5,3\rangle-$ $\langle 9,6,5,3\rangle^{\prime}+\langle 13,7,3\rangle^{*}+\langle 13,10\rangle+\langle 13,10\rangle^{\prime}$, $\therefore m \geq j$ .(3.7).
$\Rightarrow m=j$ $\qquad$
Then we have deg $\mathrm{Y}_{1} \equiv 0 \bmod ^{3}$ and $\operatorname{deg} \mathrm{Y}_{2} \equiv 0 \bmod 7^{3}$ only when $j=m=n$ so $k_{8}$ splits.
Since $\langle 9,6,5,3\rangle \neq\langle 9,6,5,3\rangle^{\prime}$ on $(7, \alpha)$ - regular classes then so $k_{7}$ must splits so we get the decomposition matrix for $B_{3}$

## Lemma (3.4):

Decomposition matrix for the block $B_{2}$ is $D_{23,7}{ }^{2}$ (see appendix 2).

## Proof:

By using ( 1,0 )-inducing of p.i.s. for $S_{22}$ to $S_{23}$ we get:
$D_{3} \uparrow^{(1,0)} S_{23}=k_{1}, \quad D_{13} \uparrow^{(1,0)} S_{23}=k_{2}, \quad D_{11} \uparrow^{(1,0)} S_{23}=c_{5}, \quad D_{12} \uparrow^{(1,0)} S_{23}=c_{6}$,
$D_{9} \uparrow^{(1,0)} S_{23}=c_{7}, \quad D_{10} \uparrow^{(1,0)} S_{23}=c_{8}, \quad D_{25} \uparrow^{(1,0)} S_{23}=c_{9}, \quad D_{26} \uparrow^{(1,0)} S_{23}=c_{10}$,
$D_{5} \uparrow^{(1,0)} S_{23}=c_{11}, \quad D_{6} \uparrow^{(1,0)} S_{23}=c_{12}, \quad D_{27} \uparrow^{(1,0)} S_{23}=k_{3}, \quad D_{28} \uparrow^{(1,0)} S_{23}=k_{4}$,
$D_{7} \uparrow^{(1,0)} S_{23}=c_{13}, \quad D_{8} \uparrow^{(1,0)} S_{23}=c_{14}, \quad D_{39} \uparrow^{(1,0)} S_{23}=k_{5}, \quad D_{43} \uparrow^{(1,0)} S_{23}=c_{17}$,
$D_{3} \uparrow^{(1,0)} S_{44}=c_{18}$,
Now we have $k_{5}=k_{3}+k_{4}-c_{11}-c_{12}$ either $k_{3}-c_{11}, k_{4}-c_{12}$ are principal.
Let $c_{15}=k_{4}-c_{12}$ and $c_{16}=k_{3}-c_{11}$.
Table(4)

| $\langle 11,8,3,1\rangle$ |  |  |  |  | 1 |  |  |  | 1 |  | 1 |  |  |  |  |  |
| $\langle 11,8,3,1\rangle^{\prime}$ |  |  |  |  |  | 1 |  |  |  | 1 |  | 1 |  |  |  |  |
| $\langle 10,8,4,1\rangle$ |  |  |  |  |  |  |  |  | 1 |  | 1 |  | 1 |  |  |  |
| $\langle 10,8,4,1\rangle^{\prime}$ |  |  |  |  |  |  |  |  |  | 1 |  | 1 |  | 1 |  |  |
| $\langle 9,8,5,1\rangle$ | 2 |  |  |  |  |  | 1 | 1 | 1 |  |  |  | 1 |  | 1 | 1 |
| $\langle 9,8,5,1\rangle^{\prime}$ | 2 |  |  |  |  |  | 1 | 1 |  | 1 |  |  |  | 1 | 1 | 1 |
| $\langle 8,7,5,2,1\rangle^{*}$ |  |  |  |  |  |  | 1 | 1 |  |  |  |  | 1 | 1 | 1 | 1 |
| $\langle 8,7,4,3,1\rangle^{*}$ |  |  |  |  |  |  |  |  |  |  |  |  | 1 | 1 | 1 | 1 |
| $\langle 8,5,4,3,2,1\rangle$ |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |
| $\langle 8,5,4,3,2,1\rangle$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |
|  | $k_{1}$ | $k_{2}$ | $c_{5}$ | $c_{6}$ | $c_{7}$ | $c_{8}$ | $c_{9}$ | $c_{10}$ | $c_{11}$ | $c_{12}$ | $c_{13}$ | $c_{14}$ | $c_{15}$ | $c_{16}$ | $c_{17}$ | $c_{18}$ |

Now $k_{1}$ is split to $c_{1}$ and $c_{2}$ [A.O.Morris and A.K.Yassen 1988].
Since $\langle 15,8,1\rangle$ and $\langle 15,8,1\rangle^{\prime}$ are projective indecomposable spin characters of $S_{24}$ (of defect 0 in $\left.S_{24}, p=7\right)$ and :
$\langle 15,8,1\rangle \downarrow S_{3}=\langle 15,8\rangle+\langle 15,7,1\rangle^{*}+\langle 14,8,1\rangle^{*}$,
$\langle 15,8,1\rangle^{\prime} \downarrow S_{3}=\langle 15,8\rangle^{\prime}+\langle 15,7,1\rangle^{*}+\langle 14,8,1\rangle^{*}$.
and since $\left(\frac{1}{2}\right) \mathrm{k}_{2}$ is a principal character of $\mathrm{S}_{23}$ [G.D.James and A.Kerber 1981] then $\left(\frac{1}{2}\right) \mathrm{k}_{2}$ must split to $c_{3}$ and $c_{4}$.

Case: $c_{3} \not \subset c_{1}$ :
Suppose $c_{3}$ is subtracted from $\mathrm{c}_{1}$, then;

$$
\left(c_{1}-c_{3}\right) \downarrow_{(1,0)} S_{22}=D_{1}+D_{14}-D_{13}
$$

is not p.s. for $S_{22}$ (see appendix1) hence: $c_{3}$ is not subtracted from $c_{1}$. Since $c_{1}, c_{2}$ are associated columns and $c_{3}, c_{4}$ are associated columns, then $c_{4}$ is not subtracted from $c_{2}$, so we get the decomposition matrix for $B_{2}$

## Section (4) block of defect three

All i.m.s. of the decomposition matrix for the block $B_{1}$ are double we have $\langle\beta\rangle=\langle\beta\rangle^{\prime}$ on (7, $\alpha$ ) -regular classes.

## Theorem (4.1):

Decomposition matrix for $S_{23}$ is [appendix 2].

## Proof:

We determine all except the block $B_{1}$. Now we find the decomposition matrix for the block $B_{1}$ By using ( $r, \bar{r}$ )-inducing of p.i.s. of $S_{22}$ to $S_{23}$ we get on:

| $D_{1} \uparrow^{(2,6)} S_{23}=c_{1}$, | $D_{54} \uparrow^{(1,0)} S_{23}=c_{2}$, | $D_{5} \uparrow^{(2,6)} S_{23}=c_{3}$, | $D_{7} \uparrow^{(2,6)} S_{23}=c_{4}$, |
| :--- | :--- | :--- | :--- | :--- |
| $D_{72} \uparrow^{(5,3)} S_{23}=c_{5}$, | $D_{13} \uparrow^{(2,6)} S_{23}=c_{6}$, | $D_{11} \uparrow^{(2,6)} S_{23}=2 c_{7}$, | $D_{17} \uparrow^{(2,6)} S_{23}=c_{8}$, |
| $D_{56} \uparrow^{(1,0)} S_{23}=2 c_{9}$, | $D_{57} \uparrow^{(1,0)} S_{23}=c_{10}$, | $D_{58} \uparrow^{(1,0)} S_{23}=c_{11}$, | $D_{23} \uparrow^{(2,6)} S_{23}=c_{12}$, |
| $D_{25} \uparrow^{(2,6)} S_{23}=2 c_{13}$, | $D_{29} \uparrow^{(2,6)} S_{23}=c_{14}$, | $D_{31} \uparrow^{(2,6)} S_{23}=c_{15}$, | $D_{74} \uparrow^{(5,3)} S_{23}=c_{16}$, |
| $D_{33} \uparrow^{(2,6)} S_{23}=c_{17}$, | $D_{35} \uparrow^{(2,6)} S_{23}=c_{18}$, | $D_{37} \uparrow^{(2,6)} S_{23}=c_{19}$, | $D_{61} \uparrow^{(1,0)} S_{23}=c_{20}$, |
| $D_{62} \uparrow^{(1,0)} S_{23}=c_{21}$, | $D_{43} \uparrow^{(2,6)} S_{23}=2 c_{22}$, | $D_{3} \uparrow^{(2,6)} S_{23}=k_{1}$, | $D_{9} \uparrow^{(2,6)} S_{23}=k_{2}$, |
| $D_{15} \uparrow^{(2,6)} S_{23}=k_{3}$, | $D_{19} \uparrow^{(2,6)} S_{23}=k_{4}$, | $D_{21} \uparrow^{(2,6)} S_{23}=k_{5}$, | $D_{27} \uparrow^{(2,6)} S_{23}=k_{6}$, |
| $D_{39} \uparrow^{(2,6)} S_{23}=k_{7}$, | $D_{41} \uparrow^{(2,6)} S_{23}=k_{8}$. | $D_{55} \uparrow^{(1,0)} S_{23}=k_{9}$ |  |

Now we have
$k_{1}=c_{2}+c_{7}+c_{13}, k_{2}=c_{5}+c_{7}, k_{3}=c_{7}+c_{9}, k_{4}=c_{10}+c_{13}, k_{5}=c_{11}+2 c_{13}, k_{6}=c_{13}+c_{16}$, $k_{7}=c_{20}+c_{22}, k_{8}=c_{21}+c_{22}$ and $k_{9}=c_{6}+c_{9}$.

Since $\left(c_{3}-c_{4}\right) \downarrow_{(2,6)} S_{22},\left(c_{1}-c_{6}\right) \downarrow_{(1,0)} S_{22},\left(c_{11}-c_{18}\right) \downarrow_{(1,0)} S_{22}, \quad\left(c_{14}-c_{17}\right) \downarrow_{(1,0)} S_{22}$ and $\left(\mathrm{c}_{15}-c_{18}\right) \downarrow_{(1,0)} S_{22}$, are not p.s., so $c_{4} \not \subset c_{3}, c_{6} \not \subset c_{1}, c_{18} \not \subset c_{11}, c_{17} \not \subset c_{14}$ and $c_{18} \not \subset c_{15}$, so we get the approximation matrix.
