• Date of research received 3/2/2024 and accepted 17/3/2024.

Abstract

This study was conducted in University of Duhok's nursery of horticulture department, college of Agriculture Engineering Sciences, in Kurdistan region of Iraq, during growing season (2022–2023). One-year-old almond seedlings were getting from college nursery. and sprayed two times: first spray was on 1st April and second spray was on 1st May. Randomized complete block design (RCBD) as factorial experiment was used, including three factors (Full green fertilizer (0, 4, 8) gm. L⁻¹, GA3 (0, 50, 100) mg. L⁻¹, and NAA (0, 750, 1250) mg. L⁻¹ (3*3*3*3), with three seedlings for each experiment unit. Statistical analysis was performed by SAS program Results were compared according to Duncan's multiple range tests at 5%. Results showed that full green significantly increased (stem length (90.11cm), shoot number (9.22), leave area (47.48 cm²), shoot dry weight (5.58gm)) at 8 mg/L⁻¹, GA3 significantly affected on (stem length (89.11cm), leave area (47.08cm²), shoot fresh weight (9.05gm), shoot dry weight (5.92gm) , root fresh weight (6.50gm), and root dry weight (3.85gm)) at 100mg/L⁻¹ , and NAA increased stem length (90.85cm) and shoot fresh weight (8.73gm) at 1250mg/L⁻¹ , while shoot number (9.59) and leave area (46.12cm²) at 750mg/L⁻¹ NAA.

Key words: Full green Fertilizer, Plant growth regulators GA3, NAA, Almond seedlings.

Introduction

Almonds are one of world's oldest commercial nut crops: they originated in West and Middle Asia and have since expanded to the Middle East, China, the Mediterranean region, and America [1]. One of the oldest tree nut varieties, almonds (*Prunus amygdalus*) are produced in greater quantities in Iran [2]. than in any other country in the world. The fertilizer led to the improvement of vegetative growth characteristics. Since all fertilizers have a variety of roles in the life of plants, giving them the nutrients they need to grow in an equilibrium shape can help to improve vegetative growth and tree production [3]. In addition to their ability to accelerate plant growth, plant growth regulators are known to improve the source-sink relationship and promote the translocation of photoassimilates, which helps in better retention of flowers and fruits. Growth regulators and promoters, such as GA3 and NAA, are responsible for initiating cell division in the cambium and stimulating vegetative growth. The primary function of auxin growth regulators is to regulate the development and expansion of roots. They are well known for their capacity to promote cell enlargement, which in turn promotes fruit growth in peaches and citrus [4]. Auxins also modify the ripening process of fruit and inhibit the typical cell wall deterioration that occurs during cold storage [5]. Through their influence on photosynthetic enzymes, leaf-area index, light interception, and improved nutrient use efficiency, they are known to increase the photosynthetic efficiency of plants. They also play a significant role in modulating a variety of processes throughout plant development. Gibberellic acid (GA3)induced integrated mechanisms increase sink strength and redistribute photosynthesis to improve source potential [6]. Furthermore, GA increases phloem loading by influencing hormone concentration, apoplast pH, and cell investigated how the fig turgor [7]. [8]. cultivar 'Poona' reacted to varying GA3 concentrations and time intervals. Fig plants treated with three sprays of GA3 at a concentration of 60 mg L⁻¹, spaced 15 days apart, beginning from bud initiation, showed a notable increase in shoot length and the quantity of functional leaves. Stem elongation

and protein synthesis are regulated bv acid gibberellic (GA3). Actually, the Gibberella fujikuroi, which causes stem elongation, recovers GA3 as a metabolic byproduct. It is an extremely strong hormone that governs plant development and is found naturally in plants. [9]. showed that, plant height, fresh and dry weights of leaves and roots were increasing highly significantly with 3 g/l of potassium nitrate graduated by 2 g/l urea and 5 g/l ammonium sulfate respectively at both seasons on date palm. Balance fertilization of NPK showed that had significant affected on leave area, diameter, height, and lateral branches of apple cultivars [10]. [11]. found that GA3 affected on chlorophyll content on anna apple tree. [12]. found that GA3 was most effective on stem height, leaf area, stem diameter, root fresh weight, root dry weight, shoot fresh and dry weights of both almond species. [13] indicated that spraying of GA3 and NAA on seedling sour orange with treatment singular and together caused a significant increasing in the rate of length, diameter, leaf area, and chlorophyll. [14]. studied that NAA and GA3 treatments recorded significantly maximum length of seedling, diameter, leaf area, chlorophyll content, fresh weight of seedling and dry weight of custard apple seedling.

[15]. was found that GA3 has significant effect on vegetative growth of almond transplants such as (diameter, number of shoots, leaf area, and chlorophyll content).

Material and Methods

This study was carried out during growing season (2022-2023) in the nursery of horticulture department, college of Agriculture Engineering Sciences, University of Duhok, Kurdistan region, Iraq. Almond seedlings onevear-old are taken from college nursery, planting in plastic pots (26cm diameter) capacity with 10kg soil. Randomized complete block design (RCBD) as factorial experiment was used, including three factors (Full green fertilizer (NPK) (0, 4, 8) gm. L⁻¹, GA3 (0, 500, 1000) mg. L⁻¹, and NAA (0, 750, 1250) mg. L⁻ ¹ with three levels (3*3*3*3) with three seedlings for each experiment unit. Statistical analysis was performed by SAS program [16]. Results were compared according to Duncan's multiple range tests at 5% [17].

In the end of study, the measurements were measured:

- 1. Stem length (cm) by tap
- 2. Stem diameter (mm) by digital Verner device

- 3. Leave area (cm²) by image program
- 4. Number of branches
- 5. Total chlorophyll content by SPAD-502 device
- 6. Shoot fresh weight (gm)
- 7. Shoot dry weight (gm)
- 8. Root fresh weight (gm)
- 9. Root dry weight (gm)

Results

Table (1) showed that spraying of full green fertilizer gave significant effect on length (90.11 cm) at 8 gm/l⁻¹ compared with control, while GA3 gave not significant effect on length parameter, however, spraying of seedlings with NAA increased (90.85 cm) the length of it at 1250mg/l⁻¹ which compared to other levels.

The triple interaction gave significant differences between data, the longest seedling (98.33 cm) was in 4gm/l^{-1} full green with 50 gm/l⁻¹ GA3 from untreated seedlings of NAA which compared with other treatments.

Table (1): Effect of full green fertilizer, Ga3, and NAA on stem length (cm) of almond seedlings.

In table (2) found that each single factor (full green fertilizer, GA3, and NAA) had not significant effect on stem diameter. Triple interaction between (full green fertilizer*GA3*NAA) gave significant decrease in stem diameter, the best diameter (5.81 mm) at untreated seedlings of full green, GA3 with 1250 mg/l⁻¹ NAA.

Table (2): Effect of full green fertilizer, Ga3, and NAA on stem diameter (mm) of almond seedlings.

Table (3) illustrated that full green fertilizer meaningfully increased shoot number (9.22) at 8gm/l⁻¹ compared to other treatments, while, GA3 found no significant effect at three levels on number of branches, in addition, NAA had significant effect (9.59) at 750mg/l⁻¹. Triple interaction between three factors had no significant effect on number of branches, the highest value was (13.33) from (untreated plants) control of each treatment.

Table (3): Effect of full green fertilizer, Ga3, and NAA on shoot number of almond seedlings.

Table (4) show us the full green fertilizer significantly increased leave area (47.48cm²) at 8gm/l⁻¹, also, GA3 had significant difference on leave area (47.08cm²) at 100mg/l⁻¹ in addition, NAA also gave significant effect (46.12cm²) at 750 mg/l⁻¹. Tri interaction gave significant difference (50.50cm²) from 8gm/l⁻¹ full green fertilizer with 100mg/l⁻¹ GA3 and 750mg/l⁻¹ NAA compared to other data

Table (5) Effect of full green fertilizer, Ga3, and NAA on leaf chlorophyll content (SPAD unit) of almond seedlings.

Table (5) illustrated that the full green fertilizer, GA3, and NAA gave significant decrease on total chlorophyll (45.86%), (45.65%), and (46.45%) respectively on untreated seedlings. Triple interaction found that the higher level (62.08%) was in 8gm/l⁻¹ full green fertilizer and from untreated seedlings of GA3 and NAA.

Table (6) show us that full green fertilizer has significant decrease on shoot fresh weigh, the maximum value was (8.67g) from control, also, GA3 & NAA factors find best shoot fresh weight respectively (9.05g and 8.73g) from 100mg/l⁻¹ GA3and 1250mg/l⁻¹ NAA.Triple interaction explained that 8gm/l⁻¹ full green fertilizer with 100mg/l⁻¹ GA3 with 750mg/l⁻¹ NAA gave best differences between data was (10.84g) compared to other data

Table (8) Effect of full green fertilizer, Ga3, and NAA on root fresh weight (gm) of almond seedlings.

Table (9) illustrated that full green significantly decreased at root dry weight (3.93g) from control, also, GA3 increased (3.85g) at 100mg/I^{-1} , otherwise, NAA does not significant difference. We found best results of

root dry weight per almond seedling and significant differences during the triple interaction, the maximum value obtained (4.98g) from 8gm/l⁻¹ full green and control each of GA3 and NAA

Discussion

The significant increasing of some studied parameters as a result to increase the levels of full green as in (length of stem, no. of branches, leave area, and shoot dry weight) Fertilizers have a significant impact on almond seedlings because they contain three essential elements for plant growth: potassium, which is important for stem and root growth and is involved in plant metabolism and protein synthesis, phosphorus, which is important for photosynthetic processes, respiration, energy storage, and cell division, and nitrogen, which promotes leaf growth, chlorophyll component, and vegetative growth and green coloration of foliage [18] [19]. According to, [20]. the primary macronutrients found in inorganic fertilizers are nitrogen, phosphorus, and potassium. These nutrients have an impact on the vegetative and reproductive phases of plant growth. Similar results were also reported by [21] on peach tree, [22] on Khaya senegalensis African Mahogny, and [23] on almond transplant. While, the most parameters were

significant differences in 100 mg/l⁻¹ GA3 as in (length of stem, leave area, shoot fresh weight, shoot dry weight, root fresh weight, and root dry weight). The reason might be attributed to the seedling's overall growth and increased rate of photosynthesis, which resulted in the seedling's overall assimilation and redistribution of photosynthesis. enhanced growth, which may be caused by GA3's rise in leaf length and width. Greater cell division and elongation finally resulted in an increase in vegetative growth. Similar results were also reported by [24] in custard apple, [25] on almond transplant. Also, NAA meaningfully increased some characteristics such as (length of stem, shoot fresh weight, number of branches, and leave area) respectively in 1250 and 750 mg/l⁻¹. NAA can also promote protein synthesis and RNA synthesis [26]; [27], as well as stimulate carbohydrate and nitrogenous material hydrolysis and translocation at the seedling, resulting in increased cell division and improved rooti

Conclusion

This conclusion explained according to the results that were obtained from the study that was conducted: the best level of full green 8gm/l⁻¹ was the effect concentration on (stem length, no. of branches, leave area, and shoot dry weight), while, GA3 in 100mg/l⁻¹ concentration obtained the best results on (stem length, leave area, shoot fresh weight, shoot dry weight, root fresh weight, root dry weight), more ever, but NAA at 750mg/l⁻¹ effect on no. of branches and leave area, also, NAA at 1250mg/l⁻¹ effect on almond seedlings in stem length and shoot fresh weight However, parameters. triple interaction significantly effects on all parameters in an excellent way.
