# Global and Suplinear Convergent VM-Algorithms for nonlinear Optimization 

Abbas Y. Al-Bayati and Maha S. Al-Salih<br>College of Computers Sciences and Mathematics<br>University of Mosul

#### Abstract

In this paper a new class of self-scaling VM-algorithms for nonlinear optimization are investigated. Some theoretical results are given on the scaling strategies that guarantee the global and super linear convergence of the new proposed algorithms. Numerical evidence on thirty two well-known nonlinear test functions is generally encouraging.

## Introduction

Consider the nonlinear optimization problem $\min _{x \in R^{n}} f(x)$, where $f$ is a nonlinear differentiable function. Assume that an exact line search is used at the beginning of each iteration k , and that for an estimate vector $\mathrm{x}_{\mathrm{k}}$ there is a symmetric and positive definite matrix $B_{k}$. The new iteration is computed by

$$
\begin{align*}
& \mathrm{d}_{\mathrm{k}}=-\mathrm{B}_{\mathrm{k}}^{-1} \mathrm{~g}_{\mathrm{k}}  \tag{1}\\
& \mathrm{x}_{\mathrm{k}+1}=\mathrm{x}_{\mathrm{k}}+\lambda_{\mathrm{k}} \mathrm{~d}_{\mathrm{k}}, \mathrm{k} \geq 1 \tag{2}
\end{align*}
$$

where $g_{k}$ is the gradient of the objective function at $x_{k} . \lambda_{k}$ is a steplength satisfies the Wolfe conditions with exact line search strategy, i.e.

$$
\begin{align*}
& \mathrm{f}\left(\mathrm{x}_{\mathrm{k}}+\lambda_{\mathrm{k}} \mathrm{~d}_{\mathrm{k}}\right) \leq \mathrm{f}\left(\mathrm{x}_{\mathrm{k}}\right)+\alpha \lambda_{\mathrm{k}} \mathrm{~g}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~d}_{\mathrm{k}}  \tag{3}\\
& \mathrm{~g}\left(\mathrm{x}_{\mathrm{k}}+\lambda_{\mathrm{k}} \mathrm{~d}_{\mathrm{k}}\right)^{\mathrm{T}} \mathrm{~d}_{\mathrm{k}} \geq \beta \mathrm{g}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~d}_{\mathrm{k}} \tag{4}
\end{align*}
$$

for $0<\alpha<\frac{1}{2}$ and $\alpha<\beta<1$.
It is important for $\mathrm{d}_{\mathrm{k}}$ to be a descent direction so that

$$
\mathrm{f}\left(\mathrm{x}_{\mathrm{k}}+\lambda_{\mathrm{k}} \mathrm{~d}_{\mathrm{k}}\right)<\mathrm{f}\left(\mathrm{x}_{\mathrm{k}}\right)
$$

for some $\lambda_{k}>0$. Thus we most have

$$
\begin{gathered}
\mathrm{d}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~g}_{\mathrm{k}}<0 \\
\text { where } \mathrm{g}_{\mathrm{k}}=\nabla \mathrm{f}\left(\mathrm{x}_{\mathrm{k}}\right)
\end{gathered}
$$

## Quasi-Newton Methods

Here

$$
\begin{equation*}
\mathrm{d}_{\mathrm{k}+1}=-\mathrm{H}_{\mathrm{k}+1} \mathrm{~g}_{\mathrm{k}+1} \tag{5}
\end{equation*}
$$

with $\mathrm{H}_{\mathrm{k}+1}$, an approximation to

$$
\begin{align*}
& \mathrm{G}_{\mathrm{k}+1}=\nabla^{2} f\left(\mathrm{x}_{\mathrm{k}+1}\right) \text { which satisfy the QN-condition defined by: } \\
& \mathrm{H}_{\mathrm{k}+1} \mathrm{y}_{\mathrm{k}}=\delta_{\mathrm{k}} \tag{6a}
\end{align*}
$$

where

$$
\left.\begin{array}{r}
\delta_{\mathrm{k}}=x_{\mathrm{k}+1}-x_{\mathrm{k}}  \tag{6b}\\
\mathrm{y}_{\mathrm{k}}=\mathrm{g}_{\mathrm{k}+1}-\mathrm{g}_{\mathrm{k}}
\end{array}\right\}
$$

A family of $\mathrm{H}_{\mathrm{k}+1}$ satisfy (5) is Broyden family

$$
\begin{align*}
H_{k+1}= & H_{k}-\frac{H_{k} y_{k} y_{k}^{T} H_{k}}{y_{k}^{T} H_{k} y_{k}}  \tag{7}\\
& +\frac{s_{k} y_{k}^{T}}{s_{k}^{T} y_{k}}+\phi_{\mathrm{k}}\left(\mathrm{y}_{\mathrm{k}}^{\mathrm{T}} \mathrm{H}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}}\right) \mathrm{L}_{\mathrm{k}} \mathrm{~L}_{\mathrm{k}}^{\mathrm{T}}
\end{align*}
$$

where

$$
\begin{equation*}
L_{k}=\frac{S_{k}}{S_{k}^{T} y_{k}}-\frac{H_{k} y_{k}}{y_{k}^{T} H_{k} y_{k}} \tag{8}
\end{equation*}
$$

and $\phi_{\mathrm{k}}$ is free parameter.Quasi Newton methods are quite efficient but need to store $\mathrm{H}_{\mathrm{k}}$ and require $\mathrm{O}\left(\mathrm{n}^{2}\right)$ multiplications per iteration to update $\mathrm{H}_{\mathrm{k}}$.

Note that this is done only for a quadratic model. But for non quadratic models, see(Al-Bayati,1993,Al-Bayati\&Al-Assady,1994 and Al-Bayati,2001). for the details of standard VM steps. For the next iteration $B_{k+1}$ is updated by Al-Bayati's VM-update i.e.

$$
\begin{equation*}
B_{k+1}=B_{k}-\frac{B_{k} s_{k} s_{k}^{T} B_{k}}{s_{k}^{T} B_{k} s_{k}}+\frac{s_{k}^{T} B_{k} y_{k}}{\left(s_{k}^{T} y_{k}\right)^{2}} \cdot y_{k}^{T} y_{k} \tag{9}
\end{equation*}
$$

See ( Al-Bayati, 1991) for more details and properties of this algorithm.

## New Suggestion

In this section we describe the prototype for the new suggested class of algorithms with self-scaling strategies:
Algorithm (1):
(1) For an starting point $\mathrm{x}_{1}$ and non singular matrix $\mathrm{V}_{1}$; set $\mathrm{k}=1$.
(2) Terminate if $\left\|g_{k+1}\right\|_{2}<\in, \in$ is small positive real number.
(3) Compute

$$
\begin{gathered}
d_{k}=-V_{k}^{T} V_{k}^{-1} g_{k} \\
x_{k+1}=x_{k}+\lambda_{k} d_{k}
\end{gathered}
$$

$\lambda_{\mathrm{k}}$ is computed by exact line search .
(4) Update

$$
\mathrm{W}_{\mathrm{k}}=\mathrm{V}_{\mathrm{k}}-\frac{\mathrm{V}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~V}_{\mathrm{k}}}{\mathrm{~s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~V}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}}}+\frac{\mathrm{s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~V}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}}}{\left(\mathrm{y}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~s}_{\mathrm{k}}\right)^{2}} \cdot \mathrm{y}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}}^{\mathrm{T}}
$$

(5) Compute the scaling parameter $\sigma_{\mathrm{k}} \geq 0$ and $\mu_{k}>0$ such that $\sigma_{\mathrm{k}} \leq \mu_{\mathrm{k}}$. If

$$
\mathbf{c}_{\mathrm{i}}= \begin{cases}\frac{\mathrm{w}_{\mathrm{i}} \text { represents the column of } \mathrm{W}_{\mathrm{k}} \text { put } \mathrm{C}_{\mathrm{k}}=}{\frac{\sigma_{\mathrm{k}}}{\left\|\mathbf{w}_{\mathrm{i}}\right\|}} \quad \text { if }\left\|\mathbf{w}_{\mathrm{i}}\right\|<\sigma_{\mathrm{k}} \\ \frac{\mu_{\mathrm{k}}}{\left\|\mathbf{w}_{\mathrm{i}}\right\|} & \text { if }\left\|\mathbf{w}_{\mathrm{i}}\right\|>\mu_{\mathrm{k}} \\ \frac{\zeta_{\mathrm{i}}}{\left\|\mathbf{w}_{\mathrm{i}}\right\|} & \text { where } \\ \zeta_{k}=\frac{\mathbf{y}_{k}^{\mathrm{T}} \mathrm{~V}_{\mathrm{k}} \mathbf{y}_{\mathrm{k}}}{\mathrm{y}_{\mathrm{k}}^{\mathrm{T}} \mathbf{s}_{\mathrm{k}}} \text { otherwise }\end{cases}
$$

$\qquad$
(6) Set $V_{k+1}=W_{k} C_{k}$
(7) set $k=k+1$ and go to step (1)

## Note that:

1- In the above algorithm

$$
\left.\begin{array}{rl}
\mathrm{B}_{1} & =\mathrm{V}_{1} \mathrm{~V}_{1}^{\mathrm{T}}  \tag{11}\\
\mathrm{~B}_{\mathrm{k}} & =\mathrm{V}_{\mathrm{k}} \mathrm{~V}_{\mathrm{k}}^{\mathrm{T}} \\
& =\mathrm{W}_{\mathrm{k}-1}^{\mathrm{T}} \mathrm{C}_{\mathrm{k}-1}^{2} \mathrm{~W}_{\mathrm{k}-1}^{\mathrm{T}} \\
& \mathrm{k}>1
\end{array}\right\}
$$

and the update is performed directly on $\mathrm{V}_{\mathrm{k}}$.
2- It will be shown that one has considered freedom in choosing $\sigma_{\mathrm{k}}$ and $\mu_{\mathrm{k}}$ of every iteration while still maintaining global convergence of the above algorithm .

## The Global Convergence of the New Algorithm (1)

In this section, we will prove that the new algorithm suggested in section (3) with an appropriate choice of the scaling parameters is globally convergent on strictly convex objective functions.
Lemma 1: For any $n \times n$ matrices $A$ and $C$, where $C$ in diagonal matrix
$\operatorname{Tr}\left(\mathrm{ACA}^{\mathrm{T}}\right)=\operatorname{tr}\left(\mathrm{AA}^{\mathrm{T}}\right)+\operatorname{tr}\left[(\mathrm{C}-\mathrm{I}) \mathrm{A}^{\mathrm{T}} \mathrm{A}\right]$
Where tr , denotes trace of any matrix.

Proof: For any two matrices A and B

$$
\operatorname{tr}(\mathrm{AB})=\operatorname{tr}(\mathrm{BA})
$$

$\Rightarrow \operatorname{tr}\left(A C A^{T}\right)=\operatorname{tr}\left(\mathrm{CA}^{\mathrm{T}} \mathrm{A}\right)$

$$
=\operatorname{tr}\left(\mathrm{AA}^{\mathrm{T}}\right)+\operatorname{tr}\left(\mathrm{CA}^{\mathrm{T}} \mathrm{~A}\right)-\operatorname{tr}\left(\mathrm{A}^{\mathrm{T}} \mathrm{~A}\right)
$$

Eq. (12) follows directly from the last equality \#
Lemma 2: Let $\mathrm{h}(\mathrm{u})=\ln \mathrm{u}-\mathrm{u}$ for $\mathrm{u}>0$
Let $\delta_{1}>0, \delta_{2}>0 \exists \delta_{3}$ and $\delta_{4}$ э
$\mathrm{x} \in\left(0, \delta_{1}\right]$ and $\mathrm{y} \in(0, \mathrm{x}] \Rightarrow \mathrm{h}(\mathrm{y})-\mathrm{h}(\mathrm{x}) \leq \delta_{3}$
And
$x \in\left[\delta_{2}, \infty\right)$ and $y \in[x, \infty) \Rightarrow h(y)-h(x) \leq \delta_{4}$
Proof: To prove eq.(13) we first note that $h(u)$ is strictly concave and its maximum occurs at $u=1$. If $x \in\left(0, \min \left(\delta_{1}, 1\right)\right)$ we conclude that for any $y$ $\in(0, x]$.
$h(y)-h(x) \leq 0$ since $h(u)$ is strictly increasing for $0<u \leq 1$.
On the other hand, if $x \in\left[\min \left(\delta_{1}, 1\right), \delta_{1}\right]$ then for any $y \in(0, x]$ we have $\mathrm{h}(\mathrm{y})-\mathrm{h}(\mathrm{x}) \leq \mathrm{h}\left[\min \left(\delta_{1}, 1\right)\right.$, $\left.\mathrm{h}\left(\delta_{1}\right)\right]$. Thus eq.(13) holds in either case with $\delta_{3}=\mathrm{h}\left[\min \left(\delta_{1}, 1\right)-\mathrm{h}\left(\delta_{1}\right)\right]$. We can prove eq.(14) in a similar line with $\delta_{4}=\mathrm{h}\left[\max \left(\delta_{2}, 1\right)-\mathrm{h}\left(\delta_{2}\right)\right]$. Details and explanations may be found in (Byrd et al, 1987).

Now let $\mathrm{G}(\mathrm{x})$ denote the Hessian matrix of f at x .
Let $\mathrm{D}(\bar{x})=\left\{x \in R^{n} ; \mathrm{f}(\mathrm{x}) \leq \mathrm{f}(\bar{x})\right\}$ be the level set of f at $\bar{x}$.
Let $\mathrm{x}_{1}$ be the starting point. Assume also
(1) f is twice continuously differentiable.
(2) $D\left(x_{1}\right)$ is convex.
(3) $\exists \mathrm{m}>\mathrm{o}$ and M э $\quad \forall \mathrm{z} \in \mathrm{R}^{\mathrm{n}}$ and $\mathrm{x} \in \mathrm{D}\left(\mathrm{x}_{1}\right)$

$$
\mathrm{m}\|\mathrm{z}\|^{2} \leq \mathrm{z}^{\mathrm{T}} \mathrm{G}(\mathrm{x}) \mathrm{z} \leq \mathrm{M}\|\mathrm{z}\|^{2}
$$

These three assumptions readily imply that $f$ is strictly convex in $D\left(x_{1}\right)$. Also $\exists$ a unique minimizer $\mathrm{x}^{*}$ of f in $\mathrm{D}\left(\mathrm{x}_{1}\right)$ and for any positive define matrix $B$, we define

$$
\begin{equation*}
\psi(\mathrm{B})=\operatorname{tr}(\mathrm{B})-\ln (\operatorname{det}(\mathrm{B})) \tag{15}
\end{equation*}
$$

This result has been used by (Byrd \& Nocedal,1989;Griewank, 1991)in their analysis of QN methods.
Let us define

$$
\begin{equation*}
\operatorname{Cos} \theta_{\mathrm{k}}=\frac{\mathrm{s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~B}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}}}{\left\|\mathrm{~s}_{\mathrm{k}}\right\|\left\|\mathrm{B}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}}\right\|} \tag{16}
\end{equation*}
$$

So that $\theta_{\mathrm{k}}$ is the angle between the search direction $\mathrm{d}_{\mathrm{k}}$ and the steepest - descent direction $-g_{k}$. Define also

$$
\begin{equation*}
\mathrm{q}_{\mathrm{k}}=\frac{\mathrm{s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~B}_{\mathrm{k}} \mathrm{~s}_{\mathrm{k}}}{\mathrm{~s}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~s}_{\mathrm{k}}} \tag{17}
\end{equation*}
$$

Also assume that the scaling parameters $\sigma_{\mathrm{k}}$ and $\mu_{\mathrm{k}}$ are bounded such that for all $k$.

$$
\begin{equation*}
\sigma_{\mathrm{k}} \leq \sigma_{\max }, \mu_{\mathrm{k}} \leq \mu_{\min } \tag{18}
\end{equation*}
$$

for some $\sigma_{\text {max }}$ and $\mu_{\text {min }}$.
The following new theorem provides the foundation for the proof of global convergence of our new suggested algorithm given in section (3). It generalizes a similar result given by (Byrd \& Nocedal, 1989)for their algorithm but for the case of unscaled BFGS algorithm.
Theorem: Let $x_{1}$ be a starting point for which $f$ satisfies eq.(12) and let $B_{1}$ be a positive definite starting Hessian approximation. Let $\left\{\mathrm{x}_{\mathrm{k}}\right\}$ be generated by the new proposed algorithm with $\sigma_{\mathrm{k}}$ and $\mu_{\mathrm{k}}$ satisfying eq.(18) and for any $\rho \in(0,1) \exists$ a constant $\beta_{1} \ni$ for any $k>1$ the relation $\operatorname{Cos} \theta_{j} \geq \beta_{1}$ holds for at least $\left[\mathrm{P}_{\mathrm{k}}\right]$ values of $\mathrm{j} \in[1, \mathrm{k}]$.
Proof: First we note that the symmetric matrices $B_{k}=V_{k} V_{k}^{T}=W_{k-1}$ $\mathrm{C}_{\mathrm{k}-1}^{2} \mathrm{~W}_{\mathrm{k}-1}^{\mathrm{T}}$ generated by the algorithm are positive definite, because the $\mathrm{W}_{\mathrm{k}-1}$ are nonsingular as a consequence of the (Al-Bayati, 1991) update, and the $\mathrm{C}_{\mathrm{k}-1}$ are nonsingular by construction.

Using the definition (15) of $\psi$, eq.(11) and lemma (4.1), we have

$$
\begin{aligned}
& \psi\left(\mathrm{B}_{\mathrm{k}+1}\right)=\operatorname{tr}\left(\mathrm{B}_{\mathrm{k}+1}\right)-\ln \left(\operatorname{det}\left(\mathrm{B}_{\mathrm{k}+1}\right)\right) \\
& \quad=\operatorname{tr}\left(\mathrm{W}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}^{2} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)-\ln \left(\operatorname{det}\left(\mathrm{W}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}^{2} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)\right) \\
& \left.=\operatorname{tr}\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)-\operatorname{tr}\left[\left(\mathrm{C}_{\mathrm{k}}^{2}-\mathrm{I}\right) \mathrm{W}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~W}_{\mathrm{k}}\right)\right]-\ln \operatorname{det}\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)-\ln \operatorname{det}\left(\mathrm{C}_{\mathrm{k}}^{2}\right) \\
& =\psi\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\operatorname{tr}\left(\left(\mathrm{C}_{\mathrm{k}}^{2}-\mathrm{I}\right) \mathrm{W}_{\mathrm{k}}^{\mathrm{T}} \mathrm{~W}_{\mathrm{k}}\right)-\ln \operatorname{det}\left(\mathrm{C}_{\mathrm{k}}^{2}\right) \\
& =\psi\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\left(\mathrm{C}_{\mathrm{i}}^{2}-\mathrm{I}\right)\left\|\mathrm{W}_{\mathrm{i}}\right\|^{2}-\ln \mathrm{C}_{\mathrm{i}}^{2}\right]
\end{aligned}
$$

Where $w_{i}$ is the $i$ th Column of $W_{k}$ now scaling up and down the set of indices of the column $\mathrm{W}_{\mathrm{k}}$ as

$$
\begin{equation*}
\mathrm{I}_{\mathrm{k}}=\left(\mathrm{i} \in[1, \mathrm{n}]:\left\|\mathrm{w}_{\mathrm{i}}\right\|<\sigma_{\mathrm{k}}\right) \tag{19}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathrm{J}_{\mathrm{k}}=\left(\mathrm{i} \in[1, \mathrm{n}]:\left\|\mathrm{w}_{\mathrm{i}}\right\|>\mu_{\mathrm{k}}\right) \tag{20}
\end{equation*}
$$

and $R_{t c}=(i \in[1, n]) \quad$ otherwise

## Journal of Kirkuk University -Scientific Studies, vol.2, No.3,2007

Therefore by define of the scalar $\mathrm{c}_{\mathrm{i}}$ in our new proposed algorithm

$$
\begin{aligned}
& \psi\left(\mathrm{B}_{\mathrm{K}+1}\right)=\psi\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{\mathrm{i} \in \mathrm{I}_{\mathrm{k}}}\left[\left(\frac{\sigma_{k}^{2}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\ln \frac{\sigma_{\mathrm{k}}^{2}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}\right] \\
& \quad+\sum_{\mathrm{i} \in \mathrm{~J}_{\mathrm{k}}}\left[\left(\frac{\mu_{k}^{2}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\ln \frac{\mu_{\mathrm{k}}^{2}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}\right] \\
& +\sum_{\mathrm{i} \in R_{\mathrm{k}}}\left[\left(\frac{\zeta^{2}{ }_{\mathrm{k}}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\ln \frac{\zeta^{2}{ }_{k}}{\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}}\right] \\
& =\psi\left(\mathrm{W}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{\mathrm{i} \in \mathrm{I}_{\mathrm{k}}}\left[\left(\ln \left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}\right)-\left(\ln \sigma_{\mathrm{k}}^{2}-\sigma_{\mathrm{k}}^{2}\right)\right] \\
& \quad+\sum_{\mathrm{i} \in \mathrm{~J}_{\mathrm{k}}}\left[\left(\ln \left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}\right)-\left(\ln \mu_{\mathrm{k}}^{2}-\mu_{\mathrm{k}}^{2}\right)\right] \\
& \quad+\sum_{\mathrm{i} \in R_{\mathrm{k}}}\left[\left(\ln \left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}-\left\|\mathrm{w}_{\mathrm{i}}\right\|^{2}\right)-\left(\ln \zeta_{\mathrm{k}}^{2}-\zeta_{\mathrm{k}}^{2}\right)\right]
\end{aligned}
$$

We will now involve lemma (4.2) with $\delta_{1}=\sigma_{\max }$ and $\delta_{2}=\mu_{\text {min }}$ since $\left\|w_{i}\right\| \leq \sigma_{k}$ for $i \in I_{k}$ whereas $\left\|w_{i}\right\| \geq \mu_{k}$ for $i \in J_{k}$ and $\left\|w_{i}\right\| \geq \zeta_{k}$ for $i \in R_{k}$ we can therefore apply eq.(13) to each term of the first summation, and eq.(14) to each term of the 2 nd summation to obtain

$$
\begin{equation*}
\psi\left(\mathrm{B}_{\mathrm{k}+1}\right) \leq \psi\left(\mathrm{w}_{\mathrm{k}} \mathrm{w}_{\mathrm{k}}^{\mathrm{T}}\right)+\mathrm{n} \delta_{3}+\mathrm{n} \delta_{4} \tag{21}
\end{equation*}
$$

for the constants $\delta_{3}$ and $\delta_{4}$ given by lemma (4.2).
Now step (4) of our new suggested algorithm (1) indicates that the matrix $W_{k} W_{k}^{T}$ is Al-Bayati's update of $B_{k}$. Therefore by the same procedure of (Byrd \& Nocedal, 1989)we can claim that $\psi\left(\mathrm{B}_{\mathrm{k}+1}\right)$ is bounded and $\cos \theta_{j} \geq B_{1}$.To ensure that the new algorithm generates a sequence of $\left\{x_{k}\right\}$ that converge to $x^{*}$, i.e.

$$
\begin{equation*}
\sum_{k=1}^{\infty}\left\|\mathrm{x}_{\mathrm{k}}-x^{*}\right\|<\infty \tag{22}
\end{equation*}
$$

and $f_{k+1}-f^{*} \leq r^{k}\left(f_{1}-f^{*}\right)$
for some constant $r \in[0,1)$
To prove (23) let us start with $\mathrm{f}_{\mathrm{k}+1}-\mathrm{f}^{*} \leq\left(1-\delta_{6} \cos ^{2} \theta_{\mathrm{k}}\right)\left(\mathrm{f}_{\mathrm{k}}-\mathrm{f}^{*}\right)$ see (Byrd et al, 1987)for the theoretical explanations.

Now since $\cos \theta_{j} \geq \beta_{1}$ then

$$
\mathrm{f}_{\mathrm{k}+1}-\mathrm{f}^{*} \leq\left(1-\delta_{6} \beta_{1}^{2}\right)\left(\mathrm{f}_{\mathrm{k}}-\mathrm{f}^{*}\right) \leq \mathrm{r}^{\mathrm{k}}\left(\mathrm{f}_{\mathrm{k}}-\mathrm{f}^{*}\right)
$$

$$
\text { with } \mathrm{r}=\left(1-\delta_{6} \beta_{1}^{2}\right) \in[0,1) \text { where } \delta_{\sigma=\frac{\alpha_{m}\left(1-B_{k}\right)}{M}}, \alpha=\beta=B_{1}
$$

The assumption on $f$ also imply that $\frac{1}{2} m\left\|x_{k}-x^{*}\right\|^{2} \leq f_{k}-f^{*}$
Therefore combining (24) with (23) we obtain

$$
\sum_{k=1}^{\infty}\left\|\mathrm{x}_{\mathrm{k}}-x^{*}\right\| \leq\left(\frac{2}{\mathrm{~m}}\right)^{\frac{1}{2}} \sum_{\mathrm{k}=1}^{\infty}\left(\mathrm{f}_{\mathrm{k}}-\mathrm{f}^{*}\right)^{\frac{1}{2}} \leq\left[\frac{2\left(\mathrm{f}_{1}-\mathrm{f}^{*}\right)}{\mathrm{m}}\right]^{\frac{1}{2}} \sum_{k=0}^{\infty}\left(\mathrm{r}^{\frac{1}{2}}\right)^{k}<\infty
$$

(since the series is geometric series and it converges to a finite sum) This proves the global convergence of our new proposed algorithm (3.1)\#

## Super Linear Convergence

First we define the following quantities to be used in this section:

$$
\begin{array}{lll}
\overline{\mathrm{B}}_{\mathrm{k}}=\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~B}_{\mathrm{k}} \mathrm{G}_{*}^{-\frac{1}{2}} & , & \overline{\mathrm{~W}}_{\mathrm{k}}=\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{k}} \\
\overline{\mathrm{~s}}_{\mathrm{k}}=\mathrm{G}_{*}^{\frac{1}{2}} \mathrm{~s}_{\mathrm{k}} & , & \overline{\mathrm{y}}_{\mathrm{k}}=\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{y}_{\mathrm{k}} \\
\overline{\mathrm{M}}_{\mathrm{k}}=\frac{\overline{\mathrm{y}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{y}}_{\mathrm{k}}}{\overline{\mathrm{y}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~s}}_{\mathrm{k}}} & , & \overline{\mathrm{~m}}_{\mathrm{k}}=\frac{\overline{\mathrm{y}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~s}}_{\mathrm{k}}}{\overline{\mathrm{~s}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~s}}_{\mathrm{k}}} \\
\overline{\mathrm{q}}_{\mathrm{k}}=\frac{\overline{\mathrm{s}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~B}}_{\mathrm{k}} \overline{\mathrm{~s}}_{\mathrm{k}}}{\overline{\mathrm{~s}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~s}}_{\mathrm{k}}} & , & \operatorname{Cos} \bar{\theta}_{\mathrm{k}}=\frac{\overline{\mathrm{s}}_{\mathrm{k}}^{\mathrm{T}} \overline{\mathrm{~B}}_{\mathrm{k}} \overline{\mathrm{~s}}_{\mathrm{k}}}{\left\|\overline{\mathrm{~s}}_{\mathrm{k}}\right\|\left\|\overline{\mathrm{B}}_{\mathrm{k}} \overline{\mathrm{~s}}_{\mathrm{k}}\right\|} \tag{28}
\end{array}
$$

where $\mathrm{G}_{*}$ is the Hessian of f at the minimizer X *.
We have shown (see lemma 4.2) that the limiting behavior of $\overline{\mathrm{q}}_{\mathrm{k}}$ and $\operatorname{Cos} \bar{\theta}_{\mathrm{k}}$ is enough to characterize the asymptotic rate of convergence of a sequence of iterates $\left\{\mathrm{x}_{\mathrm{k}}\right\}$ generated by a quasi-Newton algorithm. Their result which can be seen as a restatement of the (Dennis \& More , 1977) characterization, is reproduced in the following lemma.
Lemma: Suppose that the sequence of iterates $\left\{\mathrm{x}_{\mathrm{k}}\right\}$ is generated by algorithm (1)-(2) using some positive definite sequence $\left\{B_{k}\right\}$, and that $\lambda_{\mathrm{k}}=1$ whenever this value satisfies Wolfe conditions (3)-(4). If $\mathrm{x}_{\mathrm{k}} \rightarrow \mathrm{x} *$ then the following two conditions are equivalent :
(i) The steplength $\lambda_{k}=1$ satisfies conditions (3)-(4) for all larg $k$ and the rate of convergence is superlinear.
(ii) $\lim _{\mathrm{k} \rightarrow \infty} \operatorname{Cos} \bar{\theta}_{\mathrm{k}}=\lim _{\mathrm{k} \rightarrow \infty} \overline{\mathrm{q}}_{\mathrm{k}}=1$

Proof: Proof this lemma can be found in (Byrd \&Nocedal, 1989). The next theorem specifies conditions on the scaling parameters $\sigma_{\mathrm{k}}$ and $\eta_{\mathrm{k}}$ that allow $\overline{\mathrm{q}}_{\mathrm{k}}$ and $\operatorname{Cos} \bar{\theta}_{\mathrm{k}}$, produced by Algorithm 3.1, to exhibit the desirable limiting

## Journal of Kirkuk University -Scientific Studies, vol.2, No.3,2007

behavior of Lemma 5.1. Such conditions involve following quantities:

$$
\begin{equation*}
\gamma_{k}=\sum_{i \in I_{k}}\left[\left(\ln \left\|G_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}-\left\|G_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}\right)-\left(\ln \sigma_{k}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|\mathrm{wi}\|^{2}}-\sigma_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|\mathrm{wi}\|^{2}}\right)\right] \tag{30}
\end{equation*}
$$

and

$$
\begin{align*}
& \mu_{\mathrm{k}}=\sum_{\mathrm{i} \in \mathrm{~J}_{\mathrm{k}}}\left[\left(\ln \left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}-\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}\right)-\left(\ln \eta_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|\mathrm{wi}\|^{2}}-\eta_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|\mathrm{wi}\|^{2}}\right)\right] \\
& \left.\phi_{k}=\sum_{i \in R_{k}}\left[\ln \left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}-\left\|G_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}\right)-\left(\ln \zeta_{k}^{2} \frac{\left\|G_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|w i\|}-\zeta_{k}^{2} \frac{\left\|G_{*}^{-\frac{1}{2}} \mathrm{wi}\right\|^{2}}{\|w i\|^{2}}\right)\right] \tag{31}
\end{align*}
$$

And whether or not they sum finitely. Note that $\gamma_{\mathrm{k}}$ and $\mu_{\mathrm{k}}$ need not be positive. Recall that the sets $\mathrm{I}_{\mathrm{k}}$ and $\mathrm{J}_{\mathrm{k}}$ defined by (19) and (20) contain the indices of the columns that are scaled down at iteration k . We are now ready to state the theorem.
Theorem: Let $\mathrm{f}, \mathrm{x}_{1}, \mathrm{~B}_{1}, \sigma_{\mathrm{k}}$ and $\eta_{\mathrm{k}}$ satisfy the assumptions in theorem 4.3 . In addition, assume that $G$ is Lipschitz continuous at $x *$. Let $\left\{x_{k}\right\} \rightarrow X *$ be generated by Algorithm 3.1; then if

$$
\begin{align*}
& \sum_{k=1}^{\infty} \gamma_{k}<\infty  \tag{32}\\
& \sum_{\mathrm{k}=1}^{\infty} \mu_{\mathrm{k}}<\infty \\
& \sum_{k=1}^{\infty} \phi_{k}<\infty \tag{33}
\end{align*}
$$

the iterates converge superlinearly.
Proof: From the definition (15) of $\psi$ and from (11), (12) and (25), we have $\psi\left(\overline{\mathrm{B}}_{\mathrm{k}+1}\right)=\operatorname{tr}\left(\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}^{2} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}} \mathrm{G}_{*}^{-\frac{1}{2}}\right)-\ln \operatorname{det}\left(\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}^{2} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}} \mathrm{G}_{*}^{-\frac{1}{2}}\right)$

$$
\begin{aligned}
& =\operatorname{tr}\left(\tilde{\mathrm{W}}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}^{2} \tilde{\mathrm{~W}}_{\mathrm{k}}^{\mathrm{T}}\right)-\ln \operatorname{det}\left(\tilde{\mathrm{W}}_{\mathrm{k}} \tilde{\mathrm{~W}}_{\mathrm{k}}^{\mathrm{T}}\right)-\ln \operatorname{det}\left(\mathrm{C}_{\mathrm{k}}^{2}\right) \\
& =\psi\left(\tilde{\mathrm{W}}_{\mathrm{k}} \tilde{\mathrm{~W}}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\left(\mathrm{c}_{\mathrm{i}}^{2}-1\right)\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}-\ln \mathrm{c}_{\mathrm{i}}^{2}\right]
\end{aligned}
$$

Then by the definition (10) of $\mathrm{c}_{\mathrm{i}}$,

$$
\begin{align*}
& \psi\left(\widetilde{\mathrm{B}}_{\mathrm{k}+1}\right)= \psi\left(\tilde{\mathrm{W}}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{i \in J_{\mathrm{k}}}\left[\left(\frac{\sigma_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}-\ln \frac{\sigma_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}\right] \\
&+\sum_{i \in J_{k}}\left[\left(\frac{\eta_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}-\ln \frac{\eta_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}\right] \\
&+\sum_{i \in R_{k}}\left[\left(\frac{\zeta_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}-1\right)\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}-\ln \frac{\zeta_{\mathrm{k}}^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}\right] \\
&= \psi\left(\tilde{\mathrm{W}}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\sum_{\mathrm{i} \delta \mathrm{I}_{\mathrm{k}}}\left[\sigma_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}-\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right. \\
&\left.-\ln \sigma_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}+\ln \left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right] \\
&+ \sum_{i \in J_{k}}\left[\eta_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|}-\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right. \\
&\left.-\ln \eta_{\mathrm{k}}^{2} \frac{\| \mathrm{G}^{-\frac{1}{2}}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}+\ln \left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right] \\
&+ {\left[\sum _ { i \in J _ { k } } \left[\zeta_{\mathrm{k}}^{2} \frac{\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|}-\left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right.\right.} \\
&=\psi\left(\tilde{\mathrm{W}}_{\mathrm{k}} \mathrm{~W}_{\mathrm{k}}^{\mathrm{T}}\right)+\gamma_{\mathrm{k}}+\mu_{\mathrm{k}}+\phi_{k} \\
&\left.-\ln \zeta_{\mathrm{k}}^{2} \frac{\| \mathrm{G}_{*}^{-\frac{1}{2}}}{\left\|\mathrm{~W}_{\mathrm{i}}\right\|^{2}}+\ln \left\|\mathrm{G}_{*}^{-\frac{1}{2}} \mathrm{~W}_{\mathrm{i}}\right\|^{2}\right]  \tag{34}\\
& \sim
\end{align*}
$$

Since $\tilde{W}_{k} W_{k}^{T}$ is the matrix obtained by updating $B_{k}$ using the
(Al-Bayati,1991)formula, which is invariant under the transformation (25)- (28), we have:

$$
\begin{equation*}
\psi\left(\tilde{\mathrm{W}}_{\mathrm{k}} \tilde{\mathrm{~W}}_{\mathrm{k}}^{\mathrm{T}}\right)=\psi\left(\tilde{\mathrm{B}}_{\mathrm{k}}\right)+\left(\tilde{\mathrm{M}}_{\mathrm{k}}-\ln \tilde{\mathrm{m}}_{\mathrm{k}}-1\right)+\left(1-\frac{\tilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \theta_{\mathrm{k}}}+\ln \frac{\tilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \theta_{\mathrm{k}}}\right)+\ln \cos ^{2} \tilde{\theta}_{\mathrm{k}} \tag{35}
\end{equation*}
$$

Therefore, using (35) in (34), we have:

$$
\left.\begin{array}{rl}
\psi\left(\widetilde{\mathrm{B}}_{\mathrm{k}+1}\right)= & \psi\left(\widetilde{\mathrm{B}}_{\mathrm{k}}\right)+\left(\tilde{\mathrm{M}}_{\mathrm{k}}-\ln \widetilde{\mathrm{m}}_{\mathrm{k}}-1\right)+\left(1-\frac{\tilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \widetilde{\theta}_{\mathrm{k}}}+\ln \frac{\tilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \widetilde{\theta}_{\mathrm{k}}}\right) \\
& +\ln \cos ^{2} \tilde{\theta}_{\mathrm{k}}+\gamma_{\mathrm{k}}+\mu_{\mathrm{k}} \\
= & \psi\left(\widetilde{\mathrm{B}}_{1}\right)+\sum_{\mathrm{j}=1}^{\mathrm{k}}\left(\tilde{\mathrm{M}}_{\mathrm{j}}-\ln \widetilde{\mathrm{m}}_{\mathrm{j}}-1\right)+\sum_{\mathrm{j}=1}^{\mathrm{k}}\left[\left(1-\frac{\widetilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \widetilde{\theta}_{k}}+\ln \frac{\widetilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \widetilde{\theta}_{k}}\right)\right\} \cdots(36)
\end{array}\right\}
$$

By Theorem 4.3, we know that the iterates converge to $\mathrm{x} * \mathrm{r}$-linearly. Using this and the Lipschitz continuity of G at $\mathrm{x} *$, it is not difficult to show (Byrd \& Nocedal, 1989)that:

$$
\begin{equation*}
\sum_{\mathrm{j}=1}^{\mathrm{k}}\left(\tilde{\mathrm{M}}_{\mathrm{j}}-\ln \tilde{\mathrm{m}}_{\mathrm{j}}-1\right)<\infty \tag{37}
\end{equation*}
$$

Moreover, the hypothesis of the theorem guarantees that the last two summations in (36) are bounded above. Therefore, in order for $\psi\left(\widetilde{\mathrm{B}}_{\mathrm{k}+1}\right)$ to remain positive as $\mathrm{k} \rightarrow \infty$, the sum of the nonpositive terms in the square brackets must also be bounded. This can only be true if:
$\lim _{\mathrm{k} \rightarrow \infty}\left(1-\frac{\tilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \tilde{\theta}_{\mathrm{k}}}+\ln \frac{\widetilde{\mathrm{q}}_{\mathrm{k}}}{\cos ^{2} \theta_{\mathrm{k}}}\right)=\lim _{\mathrm{k} \rightarrow \infty} \ln \cos ^{2} \widetilde{\theta}_{\mathrm{k}}=0$
Which implies that both $\tilde{\mathrm{q}}_{\mathrm{k}}$ and $\cos ^{2} \widetilde{\theta}_{\mathrm{k}} \rightarrow 1$. Hence, superlinear convergence follows from Lemma (5.1) \#.

Now in the following section we describe a specific and modified implementation of algorithm 3.1 and make use of theory developed so far to show that it is globally and superlinearly convergent for strictly convex objective functions.

[^0]
## Compute:

$$
\begin{aligned}
& d_{k}=-L_{k}^{-T} L_{k}^{-1} g_{k}, \\
& x_{k+1}=x_{k}+\lambda_{k} d_{k}
\end{aligned}
$$

Where $\lambda_{k}$ is a steplenghth that satisfies the Wolfe conditions (The stepsize $\lambda_{\mathrm{k}}=1$ is always tried first and is accepted if admissible).

## Compute:

$$
\begin{aligned}
& \mathrm{s}_{\mathrm{k}}=\mathrm{x}_{\mathrm{k}+1}-\mathrm{x}_{\mathrm{k}} \\
& \mathrm{y}_{\mathrm{k}}=\mathrm{g}_{\mathrm{k}+1}-\mathrm{g}_{\mathrm{k}}
\end{aligned}
$$

(3) Perform the following steps to update $L_{k}$ to $W_{k}$ so that $W_{k} W_{k}^{T}$ is the Al-Bayati update of $L_{k} L_{k}^{T}$ defined in (9):
(3.1) Compute $r_{k}=L_{k}^{T} s_{k}$
(3.2) Find an orthogonal and lower matrix $\Omega_{k}$ such that $\Omega_{\mathrm{k}} \mathrm{e}_{1}=\mathrm{r}_{\mathrm{k}} /\left\|\mathrm{r}_{\mathrm{k}}\right\|$.
(3.3) Construct $W_{k}=\left\{w_{1}^{k}, w_{2}^{k}, \ldots, w_{n}^{k}\right\}$, where $w_{i}^{k}$ is given by

$$
w_{i}^{k}= \begin{cases}y_{k} / \sqrt{y_{k}^{T} s_{k}} & , i=1 \\ L_{k} \Omega_{k} e_{i} & , i=2,3, \ldots, n\end{cases}
$$

(4) Compute the scaling parameters:

If $\mathrm{k}=1, \sigma_{1}^{2}=\eta_{1}^{2}=\frac{\mathrm{y}_{1}^{\mathrm{T}} \mathrm{y}_{1}}{\mathrm{~s}_{1}^{\mathrm{T}} \mathrm{y}_{1}}=\zeta_{1}^{2}$
Otherwise, $\sigma_{\mathrm{k}}^{2}=\frac{1}{\mathrm{n}}\left[\left(\mathrm{n}-\left|\mathrm{I}_{\mathrm{k}}-1\right|\right) \sigma_{\mathrm{k}-1}^{2}+\sum_{\mathrm{i} \in \mathrm{I}_{\mathrm{k}-1}}\left\|\mathrm{~W}_{\mathrm{i}}^{\mathrm{k}-1}\right\|^{2}\right]$
Where $\mathrm{I}_{\mathrm{k}-1}=\left\{\mathrm{i} \in[1, \mathrm{n}]:\left\|\mathrm{W}_{\mathrm{i}}^{\mathrm{k}-1}\right\|<\sigma_{\mathrm{k}-1}\right\}$,
And $\eta_{\mathrm{k}}^{2}=\frac{1}{\mathrm{n}}\left[\left(\mathrm{n}-\left|\mathrm{J}_{\mathrm{k}-1}\right|\right) \eta_{\mathrm{k}-1}^{2}+\sum_{i \in J_{\mathrm{k}-1}}\left\|\mathrm{~W}_{\mathrm{i}}^{\mathrm{k}-1}\right\|^{2}\right]$,
And $\zeta_{\mathrm{k}}^{2}=\frac{1}{\mathrm{n}}\left[\left(\mathrm{n}-\left|\mathrm{R}_{\mathrm{k}-1}\right|\right) \zeta_{\mathrm{k}-1}^{2}+\sum_{i \in R_{\mathrm{k}-1}}\left\|\mathrm{~W}_{\mathrm{i}}^{\mathrm{k}-1}\right\|^{2}\right]$,
Where $\mathrm{J}_{\mathrm{k}-1}=\left\{\mathrm{i} \in[1, \mathrm{n}]:\left\|\mathrm{W}_{\mathrm{i}}^{\mathrm{k}-1}\right\|>\eta_{\mathrm{k}-1}\right\}$
Construct $\mathrm{C}_{\mathrm{k}}=$ diagonal $\left(\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{n}}\right)$ where $\mathrm{c}_{\mathrm{i}}$ givin by:
$c_{i}=\left\{\begin{array}{rll}\frac{\sigma_{\mathrm{k}}}{\left\|\mathrm{W}_{\mathrm{i}}^{\mathrm{k}}\right\|} & \text { if } & \left\|\mathrm{W}_{\mathrm{i}}^{\mathrm{k}}\right\|<\sigma_{\mathrm{k}} \\ \frac{\eta_{\mathrm{k}}}{\left\|\mathrm{W}_{\mathrm{i}}^{\mathrm{k}}\right\|} & \text { if } & \left\|\mathrm{W}_{\mathrm{i}}{ }^{\mathrm{k}}\right\|>\eta_{\mathrm{k}} \\ \frac{\zeta_{k}}{\left\|w_{i}^{k}\right\|} w^{w h e r e \zeta_{k}}= & \frac{y_{k}^{T} V_{\mathrm{k}} \mathrm{y}_{\mathrm{k}}}{y_{k}^{T} s_{\mathrm{k}}} & \text { otherwise }\end{array}\right.$

Compute: $\gamma_{\mathrm{k}+1}=\mathrm{W}_{\mathrm{k}} \mathrm{C}_{\mathrm{k}}$
(5) Set $k=k+1$ and go to step (1).

Note that: at each iteration $k$ begins with lower matrix $V_{k}$ which defines $B_{k}=V_{k} V_{k}^{T}$. Also since $L_{k}=V_{k} Q_{F}$ we have that $B_{k}=L_{k} L_{k}^{T}$. This allows V to compute the search direction by two triangular solves.

## Numerical Results

In order to asses the value of this new technique, numerical tests were carried out on a number of unconstraint optimization problems. As a standard for the purpose of comparison, the test functions, (from general literature) were solved using two different VM-algorithms.
(i) The standard BFGS algorithm.
(ii) The new proposed algorithm 6.1 (which it has been proved to be global and superlinear convergent).

All the numerical results were presented in table (1)-(4). All the algorithm terminate whenever $\mathrm{g}_{\mathrm{k}+1}^{\mathrm{T}} \mathrm{g}_{\mathrm{k}+1}<1 \times 10^{-5}$ and the two algorithms use exactly the same line search strategy, namely, the cubic fitting technique directly adapted from that published by (Bunday, 1984).

Analysis of the four tables shows that the new proposed VMalgorithm is superior to the standard BFGS algorithm. The superiority of the new algorithm is clear for high dimensionality test problems because the automatic scaling strategy.

## Final Remarks

We have described in this paper the conditions under which new automatic self-scaling algorithms based on the direct form of (Al-Bayati, 1991) VM-Update can be proved to be globally and super linearly convergent. Also some sort of numerical experiments have been done to inform the effectiveness of the new proposed algorithms. It is also possible to describe another similar algorithm based on the inverse scaled-BFGS algorithm. A column scaling algorithm which was proposed by (Siegel, 1991) may be modified and implemented with this family of algorithms.

However, values of $\sigma_{k}, \mu_{\mathrm{k}}$ selected in the new algorithm may be described (in more details) in our further work. It might occasionally be better to increase $\sigma_{\mathrm{k}}$ and to decrease $\mu_{\mathrm{k}}$. in any case, the theory developed in this paper will prove to be useful for analyzing the global and super linear convergence of these algorithms.Finally this idea may be extended to constrained optimization problems see (Al-Bayati \& Hamed, 1998) for more details.

## Appendix

## 1. Generalization Powell Function:

$$
\begin{aligned}
\mathrm{f}=\sum_{\mathrm{i}=1}^{\mathrm{n} 4}[ & \left.\mathrm{x}_{4 \mathrm{i}-3}+10 \mathrm{x}_{4 \mathrm{i}-2}\right)^{2}+5\left(\mathrm{x}_{4 \mathrm{i}-\mathrm{t}}-\mathrm{x}_{4 \mathrm{i}}\right)^{2}+\left(\mathrm{x}_{4 \mathrm{i}-2}-2 \mathrm{x}_{4 \mathrm{i}-1}\right)^{4} \\
& \left.+10\left(\mathrm{x}_{4 \mathrm{i}-3}-\mathrm{x}_{4 \mathrm{i}}\right)^{4}\right]
\end{aligned}
$$

## 2. Generalized Wood Function:

$$
\begin{aligned}
& f=\sum_{i=1}^{n 4} 100\left[\left(x_{4 i-2}+x_{4 i-3}^{2}\right)^{2}\right]+\left(1-x_{4 i-3}\right)^{2}+90\left(x_{4 i}-x_{4 i-1}^{2}\right)^{2} \\
&+\left(1-x_{4 i-1}\right)^{24}+10.1\left[\left(x_{4 i-2}+1\right)^{2}+\left(x_{4 i-1}-1\right)^{2}\right]+ 19.8\left(x_{4 i-2}-1\right)\left(x_{4 i}-1\right) \\
& ; x_{0}=(-3,-1,-3,-1 ; \ldots)^{T}
\end{aligned}
$$

## 3. Generalized Cantrel Function:

$$
\begin{array}{r}
\mathrm{f}=\sum_{\mathrm{i}=1}^{\mathrm{n} 4}\left[\exp \left(\mathrm{x}_{4 \mathrm{i}-3}\right)-\mathrm{x}_{4 \mathrm{i}-2}\right)+100\left(\mathrm{x}_{4 \mathrm{i}-2}-\mathrm{x}_{4 \mathrm{i}-1}\right)^{6}+\left(\arctan \left(\mathrm{x}_{4 \mathrm{i}-1}-\mathrm{x}_{4 \mathrm{i}}\right)\right)^{4}+\mathrm{x}_{4 \mathrm{i}-3} \\
; \mathrm{x}_{\mathrm{o}}=(1,2,2,2 ; \ldots)^{\mathrm{T}}
\end{array}
$$

## 4. Generalized Miele Function:

$$
\begin{aligned}
\mathrm{f}=\sum_{\mathrm{i}=1}^{\mathrm{n} 4} & {\left[\exp \left(\mathrm{x}_{4 \mathrm{i}-3}-\mathrm{x}_{4 \mathrm{i}-1}\right)^{2}+100\left(\mathrm{x}_{4 \mathrm{i}-2}-\mathrm{x}_{4 \mathrm{i}-1}\right)^{6}+\left(\tan \left(\mathrm{x}_{4 \mathrm{i}-1}-\mathrm{x}_{4 \mathrm{i}}\right)\right)^{4}\right.} \\
& \left.+\mathrm{x}_{4 \mathrm{i}-3}^{8}+\left(\mathrm{x}_{4 \mathrm{i}}-1\right)^{2}\right] \quad ; \mathrm{x}_{0}=(1,2,2,2 ; \ldots)^{\mathrm{T}}
\end{aligned}
$$

## 5. Cubic Function:

$\mathrm{f}=100\left(\mathrm{x}_{2}-\mathrm{x}_{1}^{3}\right)^{2}+\left(\mathrm{i}-\mathrm{x}_{1}\right)^{2}$

$$
; \mathrm{x}_{\mathrm{o}}=(1,2,2,2 ; \ldots)^{\mathrm{T}}
$$

## 6. Rosenbrock Fuaction:

$$
\mathrm{f}=100\left(\mathrm{x}_{2}-\mathrm{x}_{1}^{2}\right)^{2}+\left(i-x_{1}\right)^{2}
$$

$$
; x_{0}=(-1.2,2,1 ; \ldots)^{\top}
$$

## 7. Dixon Function:

$$
f=\left(1-x_{i}\right)^{2}+\left(1-x_{n}\right)^{2}+\sum_{i=2}^{2}\left(x_{i}-x_{i+1}\right)^{2} \quad, x_{n}=(-1, \ldots)^{2}
$$

## 8. Freudenstein Function:

$$
\begin{array}{r}
\left.\left.f=\left[-13+x_{1}-\left(\left(5-x_{2}\right) x_{2}-2\right] x_{2}\right]+\left[-29+x_{1}+\left(1-x_{2}\right) x_{2}\right)-14\right) x_{2}\right]^{2} \\
; x_{n}=(30,3)^{1}
\end{array}
$$

## List of symbols

| Symbol | Meaning |
| :---: | :--- |
| n | is the dimensions of the problems |
| K | is the K-th step of iterations |
| $\mathrm{F}_{*}$ | is the twice differentiable real value function <br> $\mathrm{x}^{*}$ |
| x | is the local minimum of $\mathrm{f}(\mathrm{x})$ |
| g | is an approximation to $\mathrm{x}^{*}$ |

# خوارزميات ذو ات التقارب الشامل و السرعة فوق الخطية في الأمثلية اللاخطية 

$$
\begin{aligned}

& \text { كلية علوم الحاسبات والرياضيات } \\
& \text { جامعة الموصل }
\end{aligned}
$$

## (لخلاصة

في هذا البحث تم التطرق إلى صنف جديد من خوارزميات المتري المتغير وفق تقنتة خاصة بالقيــاس الذاتي . وتم كذلك دراسة بعض النتائج النظرية التي تؤكد التقارب الثامل والسرعة فوق الخطية للخوارزميات الجديدة المقترحة مع دراسة عملية تؤيد كفاءة الخو ارزميات المقترحة. وباســتعمال (Y معروفة.

[^0]:    Algorithm
    Automatic column scaling (Al-Bayati, 1991)VM-algorithm. This is a modified version from our first proposed algorithm (3.1).
    (0)Choose $\mathrm{x}_{1}$ and a nonsingular and lower matrix $\mathrm{V}_{1}$; set $\mathrm{k}=1$.
    (1) Terminate if a stopping criterion is satisfied.
    (2) Find an orthogonal matrix $Q_{k}$ such that $L_{k}=V_{k} Q_{k}$ is lower triangular.
