#### Abstract

In this paper we prove the existence of $(18,9 ; f)$-arc of type $(4,9)$ when $L_{0}=13$ in the projective plane of order five , and classified it then give an example of this case. Then by personal computer we construct some projectively distinct $(13,4)$-arc in $\operatorname{PG}(2,5)$ and compare the results with $(18,9 ; f)$-arc of type $(4,9)$ .Also this paper conclude the proves of the theorems that deduced.

## 1. Introduction:

Let $\mathrm{PG}(2, \mathrm{q})$ be a projective plane $\pi$ of order $\mathrm{q}, \mathrm{a}(\mathrm{k}, \mathrm{n})$-arc A in the projective plane is a set of $k$ points, such that some $n$, but no $n+1$ of them are collinear. The following lemma are well-known and the proof found in [8].

## Lemma-1:

Let $T_{i}$ denote the total number of i-secants of $A$ in the plane $\pi$ and $R_{i}$ the number of $i$-secants of $A$ through a point $p$ in the plane, and $S_{i}$ the number of $i$ secants to A through a point Q of $\pi \backslash \mathrm{A}$, then for a (k,n)-arc A the following equations holds:

$$
\begin{align*}
& \sum_{i=0}^{n} T_{i}=q^{2}+q+1 \\
& \sum_{i=1}^{n} i T_{i}=k(q+1)  \tag{1-2}\\
& \sum_{i=2}^{n} \frac{i(i-1) T_{i}}{2}=\frac{k(k-1)}{2}  \tag{1-3}\\
& \sum_{i=1}^{n} R_{i}=q+1  \tag{1-4}\\
& \sum_{i=2}^{n}(i-1) R_{i}=k-1 \tag{1-5}
\end{align*}
$$

$$
\begin{align*}
& \sum_{i=0}^{n} S_{i}=q+1  \tag{1-6}\\
& \sum_{i=1}^{n} i S_{i}=k  \tag{1-7}\\
& i T_{i}=\sum_{p} R_{i}  \tag{1-8}\\
& (q+1-i) T_{i}=\sum_{Q} S_{i} \tag{1-9}
\end{align*}
$$

If $f$ is a function from the set of points of the projective plane $\pi$ into the set of natural number $N$, the value $f(p)$ is called the weight point $p$ and if $F$ is a function from the set of lines of $\pi$ into $N$, the value $F(r)$ is called the weight line $r$, that is $F(r)=\sum_{p \in r} f(p)$.

A ( $k, n ; f$ )-arc $K$ of $\pi$ is a set of $k$ points such that $K$ does not contain any points of weight zero. The line $r$ of $\pi$ is called i-secant if the total weight of $r$ is $i . L_{j}$ denotes the number of points having weight $j$ for $j=0,1,2, \ldots, w$ and we used $V_{i}{ }^{j}$ for the number of lines of weight $i$ through a point of weight $j$, we also denote the number of lines of weight $i$ by $t_{i}$, the integers $t_{i}$ are called the characters of $K$.If the points in the plane are only of weight zero and one ,then K is a ( $\mathrm{k}, \mathrm{n}$ )-arc.

The development of the theory of $(\mathrm{k}, \mathrm{n} ; \mathrm{f})$-arcs is due ,essentially, to D’Agostini [1] \& [2]. Also [3] \& [5] proves the existence of this arc for different projective planes. [6] study (k,n;f)-arcs of type (m,n) in $\operatorname{PG}(2,5)$ and show that this arc does not exist when $\mathrm{L}_{0}=13$.

In this paper we prove the existence of this arc when $L_{0}=13$, and classified it, then give an examples of this case.

Let $W$ denote the total weight of $K$, so by [1] we have :

$$
\begin{equation*}
\mathrm{m}(\mathrm{q}+1) \leq \mathrm{W} \leq(\mathrm{n}-\mathrm{w})(\mathrm{q}+1)+\mathrm{w} \tag{1-10}
\end{equation*}
$$

Arcs for which equality holds on the left are called minimal and arcs for which equality holds on the right are called maximal .Also [1] proved to be a necessary condition for the existence of $a(k, n ; f)-\operatorname{arc} K$ of type $(m, n), 0<m<n$ is that

$$
\begin{equation*}
\mathrm{q} \equiv 0 \bmod (\mathrm{n}-\mathrm{m}) \tag{1-11}
\end{equation*}
$$

And

$$
\begin{equation*}
\mathrm{w} \leq \mathrm{n}-\mathrm{m} \tag{1-12}
\end{equation*}
$$

## Theorem-1:

Let K be a $(\mathrm{k}, \mathrm{n} ; \mathrm{f})$-arc of type $\left(\mathrm{t}_{1}=\mathrm{m}, \ldots, \mathrm{t}_{\mathrm{r}}=\mathrm{n}\right)$ for which the maximum weight of any point is $w$. Define a new ( $k, n ; f$ )-arc $K$ by $f(p)=w-f(p)$ for each point $p$ in the plane. Then $\mathrm{K}^{\prime}$ is maximal iff , K is a minimal .

## Proof : See [6]

## Theorem-2:

For a minimal $(k, n ; f)$-arc of type $(\mathrm{n}-5, \mathrm{n})$ in $\mathrm{PG}(2,5)$, we have :

$$
\begin{array}{ll}
V_{n-5}^{0}=q+1 & V_{n}^{0}=0 \\
V_{n-5}^{1}=\frac{4}{5} q+1 & V_{n}^{1}=\frac{1}{5} q
\end{array}
$$

$$
\begin{array}{ll}
V_{n-5}^{2}=\frac{3}{5} q+1 & V_{n}^{2}=\frac{2}{5} q \\
V_{n-5}^{3}=\frac{2}{5} q+1 & V_{n}^{3}=\frac{3}{5} q  \tag{1-13}\\
V_{n-5}^{4}=\frac{1}{5} q+1 & V_{n}^{4}=\frac{4}{5} q \\
V_{n-5}^{5}=1 & V_{n}^{5}=q
\end{array}
$$

Proof : See[4]

## 2. ( $\mathbf{k}, \mathbf{n} ; \mathbf{f}$ )-arcs of type ( $\mathbf{n}-5, n$ ) with $L_{i}>0, i=0,1,2 \& L_{i}=0, j=3,4,5$ :

Let $t_{n-5}$ be the number of lines of weight $n-5$ and $t_{n}$ be the number of lines of weight $n$, then

$$
\begin{align*}
& \mathrm{t}_{\mathrm{n}-5}+\mathrm{t}_{\mathrm{n}}=\mathrm{q}^{2}+\mathrm{q}+1  \tag{2-1}\\
& (\mathrm{n}-5) \mathrm{t}_{\mathrm{n}-5}+\mathrm{nt}_{\mathrm{n}}=\mathrm{w}(\mathrm{q}+1)=(\mathrm{n}-5)(\mathrm{q}+1)^{2}
\end{align*}
$$

Solving (2-1) \& (2-2) gives
$\mathrm{t}_{\mathrm{n}}=(1 / 5)(\mathrm{n}-5) \mathrm{q}$
$\mathrm{t}_{\mathrm{n}-5}=(1 / 5)\left(5 \mathrm{q}^{2}+10 \mathrm{q}-\mathrm{nq}+5\right)$
Now let M be an n -secant which has no point of weight 0 and suppose that on M there are $\alpha$ points of weight 2 and $\beta$ of weight 1 , then counting points of M gives:

$$
\alpha+\beta=\mathrm{q}+1
$$

and the weight of points on $M$ gives:

$$
2 \alpha+\beta=\mathrm{n}
$$

that is

$$
\left.\begin{array}{l}
\alpha=\mathrm{n}-(\mathrm{q}+1) \\
\beta=2(\mathrm{q}+1)-\mathrm{n}
\end{array}\right\}
$$

Counting the incidences between points of weight 1 and $n$-secants gives :

$$
\mathrm{L}_{1} \mathrm{~V}_{\mathrm{n}}{ }^{1}=\mathrm{t}_{\mathrm{n}} \beta
$$

By using (1-13) and the equations (2-3) and (2-5) we have

$$
\begin{equation*}
\mathrm{L}_{1}=(\mathrm{n}-5)(2 \mathrm{q}+2-\mathrm{n}) \tag{2-6}
\end{equation*}
$$

Similarly ,counting incidences between points of weight 2 and the $n$-secants gives:

$$
\mathrm{L}_{2} \mathrm{~V}_{\mathrm{n}}^{2}=\mathrm{t}_{\mathrm{n}} \alpha
$$

Hence, using (1-13) and the equations (2-3) and (2-5) we have

$$
\mathrm{L}_{2}=[(\mathrm{n}-5)(\mathrm{n}-\mathrm{q}-1)] / 2
$$

Since

$$
\mathrm{L}_{0}+\mathrm{L}_{1}+\mathrm{L}_{2}=\mathrm{q}^{2}+\mathrm{q}+1
$$

Then by equations (2-6) and (2-7) we get

$$
\begin{equation*}
2 q^{2}-(17-3 n) q+n^{2}-8 n+17-2 L_{0}=0 \tag{2-8}
\end{equation*}
$$

## 3-The case when the number of points of weight 0 is thirteen :

Applying equation (2-8) when $\mathrm{L}_{0}=13$, we get

$$
\begin{equation*}
2 q^{2}-(17-3 n) q+n^{2}-8 n-9=0 \tag{3-1}
\end{equation*}
$$

we know that the discriminant of algebraic equation of degree two is
$\Delta=\mathrm{b}^{2}-4 \mathrm{ac}$, where $\mathrm{b}=(17-3 \mathrm{n}), \mathrm{a}=2$, and $\mathrm{c}=\mathrm{n}^{2}-8 \mathrm{n}-9$, then $\Delta$ becomes
$\Delta=(\mathrm{n}-19)^{2}$
From equations (2-6),(2-7), it is clear that $5<n \leq 12$, and all the possibilities of solutions of (3-1) are given in the following table-1 .

Table-1

| n | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\Delta$ | 169 | 144 | 121 | 100 | 81 | 64 | 49 |
| q | $1.5,-7$ | $4,-2$ | $-1,4.5$ | 0,5 | $1,5.5$ | 2,6 | $3,6.5$ |

Hence the only solution of these compatible with $\mathrm{n} \& \Delta$ being non-negative integers and $\mathrm{q} \equiv 0 \bmod (\mathrm{n}-\mathrm{m})$ is $\Delta=100$ and $\mathrm{n}=9$.
From equation (1-10) and equation (1-12), we get the following for our case:

1) $\quad 1 \leq w \leq 5$
2) $24 \leq \mathrm{W} \leq 44$

From theorem-1 we get the maximum case.
Now we discuss the minimum case when $\mathrm{W}=24$, from theorem- 2 we have the following results:

$$
\left.\begin{array}{ll}
V_{4}^{0}=6 & V_{9}^{0}=0  \tag{3-2}\\
V_{4}^{1}=5 & V_{9}^{1}=1 \\
V_{4}^{2}=4 & V_{9}^{2}=2
\end{array}\right\}
$$

Since 9 -secant does not contain any point of weight 0 , then we give the following lemma:

## Lemma-2:

No point of weight zero lies on any 9 - secant of a $(18,9 ; f)$-arc of type $(4,9)$.
Proof: From (table-1) when $n=9$. It is clear by theorem-2 and equation (3-2), $V_{9}^{0}=0$.

## Theorem-3:

No five points of weight zero can be collinear.
Proof: Suppose that there is a 4-secant line $r$, such that $r$ have five points of weight zero. Then the other point on $r$ has at most weight 2 , means that the weight of $r$ is two which is a contradiction.

## Corollary:

The points of weight 0 form a $(13,4)$-arc

## Lemma-3:

## Makbola J.

For the existence $\operatorname{of}(18,9 ; f)$-arc K of type $(4,9)$ and the points of weight 0 form (13,4)-arc in $\operatorname{PG}(2,5)$, we must have the following:

1) The number $t_{9}$ of 9 -secants of $K$ is four
2) The number $t_{4}$ of 4 -secants of $K$ is twenty seven
3) The number $L_{2}$ of points of weight 2 is six
4) The number $L_{1}$ of points of weight 1 is twelve

Proof: Follows from equations (2-3),(2-4),(2-6) \& (2-7).

## 4- Classification of the lines of the plane with respect to an (18,9;f)-arc of type (4,9) :

Let X be an 9 -secant of $(18,9 ; \mathrm{f})$-arc K , since $V_{9}{ }^{0}=0$, then on X there are only
points of weight 2 and points of weight 1 , suppose that on X there are $\alpha$ points of weight 2 and $\beta$ points of weight 1 , then

$$
\alpha+\beta=6
$$

Counting the points of weights $2 \& 1$ on X , we get
$2 \alpha+\beta=9$
Hence the unique solution of these equations is

$$
\alpha=3, \quad \beta=3
$$

Suppose that $\mathrm{r}_{1}$ be a 4 -secant having one point of weight $0, \alpha$ points of weight 2 and $\beta$ points of weight 1 , then

$$
\alpha+\beta=5
$$

$$
2 \alpha+\beta=4
$$

There is no solution of these equations. Hence there does not exist 1 -secant of K
Suppose that $r_{2}$ be a 4 -secant having two points of weight $0, \alpha$ points of weight 2
and $\beta$ points of weight 1 , then
$\alpha+\beta=4$
$2 \alpha+\beta=4$
So $\alpha=0, \beta=4$
Suppose that $r_{3}$ be a 4-secant having three points of weight $0, \alpha$ points of weight 2
and $\beta$ points of weight 1 , then

$$
\begin{aligned}
& \alpha+\beta=3 \\
& 2 \alpha+\beta=4
\end{aligned}
$$

So $\alpha=1, \beta=2$
Suppose that $r_{4}$ be a 4 -secant having four points of weight $0, \alpha$ points of weight 2 and $\beta$ points of weight 1 , then
$\alpha+\beta=2$
$2 \alpha+\beta=4$
So $\alpha=2, \beta=0$
These are the possible solutions

Existence Of (18,9;f)-Arc Of Type (4,9) In PG(2,5)...
From the above we conclude the following table-2

## Table-2

| Type of the lines | Points of weight 0 | Points of weight 1 | Points of weight 2 |
| :---: | :---: | :---: | :---: |
| $\mathrm{r}_{2}$ | 2 | 4 | 0 |
| $\mathrm{r}_{3}$ | 3 | 2 | 1 |
| $\mathrm{r}_{4}$ | 4 | 0 | 2 |
| X | 0 | 3 | 3 |

Hence, we have proved the following lemma-4 :

## Lemma -4:

The lines of $\mathrm{PG}(2,5)$ are partitioned into four classes with respect to a minimal $(18,9 ; f)$-arc of type $(4,9)$ as follows:

1) $r_{2}$ which contains two points of weight 0 , and four points of weight 1
2) $r_{3}$ which contains three points of weight 0 ,two points of weight 1 and
one points of weight 2
3) $r_{4}$ which contains four points of weight 0 , and two points of weight 2
4) $X$ which contains three points of weight 1 , and three points of weight 2

## Corollary -1:

There is no point of weight 1 on the 4 -secant of $(13,4)$-arc

## Corollary -2:

There is no point of weight 2 on the 2 -secant of (13,4)-arc

## 5-The Projectively distinct (13,4)-arc in PG(2,5):

Since the numbers of probabilities for finding the projectively distinct ( $\mathrm{k}, \mathrm{n}$ )-arcs is very large, it is impossible to construct these arcs by hand, so we used computer program. The program used in Fortran 77 which was taken from [7] and update it to be suitable for the plane $\operatorname{PG}(2,5)$, then we find some projectively distinct $(13,4)$-arc listed in the following table-3

Table-3

| $\begin{aligned} & (13,4)- \\ & \operatorname{arc} \mathrm{Y}_{\mathrm{i}} \end{aligned}$ | Points of $\mathrm{Y}_{\mathrm{i}}$ |  |  |  |  |  |  |  |  |  |  |  |  | Number of $\mathrm{T}_{4}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{A}_{1}$ | $\mathrm{A}_{2}$ | $\mathrm{A}_{3}$ | $\mathrm{A}_{4}$ | $\mathrm{A}_{5}$ | $\mathrm{A}_{6}$ | $\mathrm{A}_{7}$ | $\mathrm{A}_{8}$ | $\mathrm{A}_{9}$ | $\mathrm{A}_{10}$ | $\mathrm{A}_{11}$ | $\mathrm{A}_{12}$ | $\mathrm{A}_{13}$ |  |
| $\mathrm{Y}_{1}$ | 29 | 30 | 0 | 22 | 1 | 3 | 6 | 8 | 10 | 14 | 17 | 23 | 27 | 5 |
| $\mathrm{Y}_{2}$ | 29 | 30 | 0 | 22 | 3 | 4 | 6 | 8 | 10 | 14 | 17 | 23 | 27 | 4 |

Makbola J.

| $\mathrm{Y}_{3}$ | 29 | 30 | 0 | 22 | 2 | 3 | 4 | 5 | 6 | 13 | 14 | 23 | 28 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Y}_{4}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 4 | 13 | 14 | 17 | 23 | 28 | 7 |
| $\mathrm{Y}_{5}$ | 29 | 30 | 0 | 22 | 2 | 3 | 4 | 5 | 6 | 14 | 17 | 23 | 28 | 8 |
| $\mathrm{Y}_{6}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 4 | 8 | 12 | 15 | 17 | 18 | 6 |
| $\mathrm{Y}_{7}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 6 | 9 | 12 | 23 | 24 | 26 | 3 |
| $\mathrm{Y}_{8}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 4 | 6 | 9 | 14 | 17 | 23 | 6 |
| $\mathrm{Y}_{9}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 4 | 6 | 10 | 14 | 17 | 23 | 7 |
| $\mathrm{Y}_{10}$ | 29 | 30 | 0 | 22 | 1 | 2 | 3 | 4 | 6 | 14 | 17 | 23 | 28 | 9 |
| $\mathrm{Y}_{11}$ | 29 | 30 | 0 | 22 | 2 | 6 | 13 | 14 | 18 | 21 | 23 | 27 | 28 | 5 |

## 6- Notations on $(13,4)$-arc:

Let $\mathrm{p} \in \mathrm{K}$ and suppose that through p there are $\alpha$ (4-secant), $\beta$ (3-secant), $\gamma$ (2-secant) and $\delta$ (1-secant) then by using equations (1-4) \& (15) of lemma-1 we get

$$
\begin{align*}
& \alpha+\beta+\gamma+\delta=6  \tag{6-1}\\
& 3 \alpha+2 \beta+\gamma=12
\end{align*}
$$

From (6-1) \& (6-2) we have seven non-negative solutions explained in table-4 below :

Table-4

| Type of the points | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ |
| :---: | :---: | :---: | :---: | :---: |
| type -1 | 0 | 6 | 0 | 0 |
| type -2 | 1 | 4 | 1 | 0 |
| type -3 | 2 | 2 | 2 | 0 |
| type -4 | 2 | 3 | 0 | 1 |
| type -5 | 3 | 0 | 3 | 0 |
| type -6 | 3 | 1 | 1 | 1 |
| type -7 | 4 | 0 | 0 | 2 |

If there are:
$\mathrm{X}_{1}$ points of type 1
$X_{2}$ points of type 2
$X_{3}$ points of type 3
$X_{4}$ points of type 4
$\mathrm{X}_{5}$ points of type 5
$X_{6}$ points of type 6
$X_{7}$ points of type 7
Then from equation (1-8) of lemma-1 and (table-4), we have:

$$
\begin{align*}
& X_{1}+X_{2}+X_{3}+X_{4}+X_{5}+X_{6}+X_{7}=13  \tag{6-3}\\
& X_{2}+2 X_{3}+2 X_{4}+3 X_{5}+3 X_{6}+4 X_{7}=12  \tag{6-4}\\
& 6 X_{1}+4 X_{2}+2 X_{3}+3 X_{4}+X_{6}=54  \tag{6-5}\\
& X_{2}+2 X_{3}+3 X_{5}+X_{6}=12  \tag{6-6}\\
& X_{4}+X_{6}+2 X_{7}=0 \tag{6-7}
\end{align*}
$$

Let $\mathrm{z} \notin \mathrm{K}$ and suppose that through z there are

```
Existence Of (18,9;f)-Arc Of Type (4,9) In PG(2,5)...
```

$\alpha$ (4-secant), $\beta$ (3-secant), $\gamma$ (2-secant), $\delta$ (1-secant) and $\varepsilon$ ( 0 -secant) then by using equations (1-6) \& (1-7) of lemma-1 we have

$$
\begin{align*}
& \alpha+\beta+\gamma+\delta+\varepsilon=6  \tag{6-8}\\
& 4 \alpha+3 \beta+2 \gamma+\delta=13 \tag{6-9}
\end{align*}
$$

Equations (6-8) \& (6-9) have sixteen non-negative integral solutions explained in table-5 below :

Table-5

| Type of the | 4-secant | 3-secant <br> point | $\alpha$ | $\beta$-secant | 1-secant |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\gamma$ | 0 -secant |  |  |  |  |
| $\mathrm{D}_{1}$ | 0 | 4 | 0 | 1 | $\varepsilon$ |
| $\mathrm{D}_{2}$ | 0 | 3 | 2 | 0 | 1 |
| $\mathrm{D}_{3}$ | 0 | 3 | 1 | 2 | 0 |
| $\mathrm{D}_{4}$ | 0 | 2 | 3 | 1 | 0 |
| $\mathrm{D}_{5}$ | 0 | 1 | 5 | 0 | 0 |
| $\mathrm{D}_{6}$ | 1 | 3 | 0 | 0 | 2 |
| $\mathrm{D}_{7}$ | 1 | 2 | 1 | 1 | 1 |
| $\mathrm{D}_{8}$ | 1 | 2 | 0 | 3 | 0 |
| $\mathrm{D}_{9}$ | 1 | 1 | 3 | 0 | 1 |
| $\mathrm{D}_{10}$ | 1 | 1 | 2 | 2 | 0 |
| $\mathrm{D}_{11}$ | 1 | 0 | 4 | 1 | 0 |
| $\mathrm{D}_{12}$ | 2 | 0 | 2 | 1 | 1 |
| $\mathrm{D}_{13}$ | 2 | 1 | 1 | 0 | 2 |
| $\mathrm{D}_{14}$ | 2 | 1 | 0 | 2 | 1 |
| $\mathrm{D}_{15}$ | 2 | 0 | 1 | 3 | 0 |
| $\mathrm{D}_{16}$ | 3 | 0 | 0 | 1 | 2 |

Suppose there are $\beta_{i}$ points of type $\mathrm{D}_{\mathrm{i}}, \mathrm{i}=1, \ldots, 16$ then counting the point of the
plane $\pi \backslash \mathrm{A}$, when A is a $(13,4)$-arc in $\mathrm{PG}(2,5)$ obtain the following :

$$
\begin{equation*}
\sum_{i=1}^{16} \beta_{i}=|\pi \backslash A|=18 \tag{6-10}
\end{equation*}
$$

By using equation (1-9) of lemma-1 and (table-5) the following equations are obtained:

$$
\begin{align*}
& \beta_{6}+\beta_{7}+\beta_{8}+\beta_{9}+\beta_{10}+\beta_{11}+2 \beta_{12}+2 \beta_{13}+2 \beta_{14}+2 \beta_{15}+3 \beta_{16} \\
& =2 \mathrm{~T}_{4}  \tag{6-11}\\
& 4 \beta_{1}+3 \beta_{2}+3 \beta_{3}+2 \beta_{4}+\beta_{5}+3 \beta_{6}+2 \beta_{7}+2 \beta_{8}+\beta_{9}+\beta_{10}+\beta_{13}+\beta_{14} \\
& =3 \mathrm{~T}_{3}+\ldots .(6-1  \tag{6-12}\\
& 2 \beta_{2}+\beta_{3}+3 \beta_{4}+5 \beta_{5}+\beta_{7}+3 \beta_{9}+2 \beta_{10}+4 \beta_{11}+2 \beta_{12}+\beta_{13}+\beta_{15} \\
& =4 \mathrm{~T}_{2}  \tag{6-13}\\
& \beta_{1}+2 \beta_{3}+\beta_{4}+\beta_{7}+3 \beta_{8}+2 \beta_{10}+\beta_{11}+\beta_{12}+2 \beta_{14}+3 \beta_{15}+\beta_{16}
\end{align*}
$$

$=5 \mathrm{~T}_{1}$
$\beta_{1}+\beta_{2}+2 \beta_{6}+\beta_{7}+\beta_{9}+\beta_{12}+2 \beta_{13}+\beta_{14}+2 \beta_{16}=6 \mathrm{~T}_{0}$

From equations (1-1), (1-2) \& (1-3) of lemma-1, we get
$\mathrm{T}_{0}+\mathrm{T}_{1}+\mathrm{T}_{2}+\mathrm{T}_{3}+\mathrm{T}_{4}=31$
$\mathrm{T}_{1}+2 \mathrm{~T}_{2}+3 \mathrm{~T}_{3}+4 \mathrm{~T}_{4}=78$
$\mathrm{T}_{2}+3 \mathrm{~T}_{3}+6 \mathrm{~T}_{4}=78$
From (table-3) we have $\mathrm{T}_{4} \leq 9$, then the solutions of the equations (a),(b) \& (c) are listed in the following table-6

Table - 6

| $\mathrm{T}_{4}$ | $\mathrm{~T}_{3}$ | $\mathrm{~T}_{2}$ | $\mathrm{~T}_{1}$ | $\mathrm{~T}_{0}$ |
| :---: | :---: | :---: | :---: | :---: |
| 5 | 14 | 6 | 4 | 2 |

## Lemma-5:

The points of weight 2 of the $(18,9 ; f)$-arc K of type $(4,9)$ are points of type $D_{6}, D_{13} \& D_{16}$ when the point of weight 0 form a $(13,4)$-arc.

Proof: From equation (3-2) through a point of weight 2 there pass two 9secants of $K$, suppose $Q$ is a point of type $D_{8}$, and suppose having weight 2, from (table-5) the following pass through Q one 4 -secants ,two 3-secants and three 1-secants.

But lemma- 4 shows that the i -secants $(\mathrm{i}=1,2,3,4$ ) of a $(13,4)$-arc are 4 -secants of K and the 0 -secants of a $(13,4)$-arc which have point of weight 2 are 9 secants of K .

Hence through Q there pass six 4 -secants of K and zero 9 -secants of K .
Which is a contradiction because $V_{4}^{2}=4, V_{9}^{2}=2$
That is the points of type $\mathrm{D}_{8}$ are not points of weight 2 .
By the same way we can show that the points of type $D_{i}, i=1, \ldots, 15, i \neq 6$, 13. Suppose p is a point of type $\mathrm{D}_{6}$ and suppose it has weight 2 , from (table5) through $p$ there pass one 4 -secants three 3 -secants and two 0 -secants of $(13,4)$-arc ,we showed in lemma-4 that the i-secants $(i=1,2,3,4)$ (which

```
Existence Of (18,9;f)-Arc Of Type \((\mathbf{4 , 9})\) In PG(2,5) \(\ldots\)
```

are 4 -secants of K$)$ and the two 0 -secants of the $(13,4)$-arc which are either 9 secants or 4 -secants with respect to K according to p is a point of weight 2 or weight 1 respectively. Hence $p$ is possibly a point of weight 2 . Similarly we can prove for $\mathrm{D}_{13} \& \mathrm{D}_{16}$.

## Corollary:

Let K be a $(18,9 ; \mathrm{f})$-arc of type $(4,9)$, then the points of weight 1 of K are points of type $D_{i}$ of $K, i=1, \ldots, 16$.

Example: An example may be found in $\mathrm{PG}(2,5)$ of $(18,9 ; f)$-arc of type $(4,9)$ when the points of weight 0 form $(13,4)$-arc shown in (table-7)

## Remarks on (table-7):

1) The points are marked inside ellipse are the points of weight 0
2) The underlined points are points of weight 2
3) The other points are points of weight 1 .

Table-7

| Lines | Points |  |  |  |  |  | Type | The equation | W ( $\mathrm{L}_{\mathrm{j}}$ ) |

## 7- Existence of the $(18,9 ; f)$-arc of type $(4,9)$ :

From the example in (table-7) we see that all the points of weight 2 are of type $D_{6}$ and all the points of weight 1 are of type $D_{2}$, that is $D_{i}=0$ for $i=$ $1, \ldots, 16, i \neq 2,6$.
Then the only solution of equations (6-10), $\ldots,(6-15)$ is $\beta_{2}=12, \beta_{6}=6, \beta_{\mathrm{i}}=0$ for $i=1, \ldots, 16, i \neq 2,6$

## 8 -The case of $(13,4)$-arc with three 4 -secants :

When $\mathrm{X}=\{29,30,0,22,1,2,3,6,9,12,23,24,26\}$ and by using (table-6), we get: $\mathrm{T}_{4}=3, \mathrm{~T}_{3}=18, \mathrm{~T}_{2}=6, \mathrm{~T}_{1}=0, \mathrm{~T}_{0}=4$ and the solutions of (63) , ..., (6-7) are : $X_{1}=4, X_{2}=6, X_{3}=3$, and $X_{4}=X_{5}=X_{6}=X_{7}=0$.
That is : there are four points of $(13,4)$-arc of type 1 , these points are :
$1=(1,-1,-2), 9=(1,2,1), 24=(1,1,-1) \& 29=(1,0,0)$,six points of type 2 which are :
$0=(0,0,1), 2=(1,2,0), 6=(1,-1,-1), 22=(1,1,1), 26=(1,0,-2) \& 30=(0$, $1,0)$, and the three points of type 3 are : $3=(0,1,2), 12=(0,1,-2) \& 23$ $=(1,-2,2)$,
see (table-7) .
Again from (table-7) the twelve points of weight 1 which are of type $D_{2}$ are :
$7=(1,0,2), 10=(1,-2,1), 11=(1,-2,0), 13=(1,-1,1), 14$
$=(1,-2,-1)$,
$16=(1,-2,-2), 17=(1,2,2), 18=(1,1,2), 19=(1,1,0), 21$
$=(1,-1,2)$,
$25=(1,0,-1), 27=(1,2,-2)$, and the six points of weight 2 which are of type $\mathrm{D}_{6}$ are :
$4=(1,-1,0), 5=(0,1-1), 8=(1,1,-2), 15=(1,0,1), 20=(0,1,1)$, $28=(1,2,-1)$.
